00108185

22 per cent. *not* according to the rites of the Established Church. 20,297 marriages were by licence, 118,274 after banns, 4281 on superintendent registrar's certificate; and in 3171 instances it is not stated under which of these heads the marriages should be placed. In Roman Catholic chapels there were 8,911 marriages, in the registered places of other Christian denominations 17,215 marriages; and in the offices of Superintendent Registrars 15,246. The 63 nuptial celebrations among Quakers

* In the case of mixed marriages between Protestants and Roman Catholics some couples are married twice, and are counted twice in the Registers.

are 9 in excess of the previous year, and the 301 marriages of Jews show a diminution of 52.

The marriages were above the average: the increase in the number of persons married which was noticed in 1863, augmented in each following year, and reached the high proportion of 1·770 persons married in 1866 to every 100 persons living, the average rate being 1·652. The excess in the number of marriages was spread over the first nine months of the year; the commercial distress, which began to be severely felt in May, influenced the marriage-rate in the last three months of the year, when it fell below that of the corresponding season of 1865. 832 in 100,000 persons living may be estimated to represent the marriage-rate of the higher and middle classes, and 895 in 100,000 the marriage-rate among the other classes of the community.

TABLE 4.—**Proportion** of **Marriages** and comparison of those celebrated by **Licence** and **not by Licence**, together with the Price of Wheat per Quarter in **England** in each **Year** from **1841** to **1866**.

1851	·858	5·591	·884	·853	38 6

* Disregarding the decimal point, this will read:—804 marriages were celebrated to every 100,000 of the population; 910 in 100,000 represent the marriage-rate of the higher and middle classes, and 787 in 100,000 the marriage-rate among the other classes of the community.

There were 23 marriages in which one or other of the contracting parties is stated to have been previously divorced, thus 9 divorced men married spinsters, 5 divorced men married widows, 8 bachelors and one widower married divorced women; these numbers are considerably less than in the previous year, when there were 48 cases of marriage after divorce.

Buildings registered for marriage.—There were 5576 buildings for the solemnization of marriages on the register at the end of the year 1866; of these 1666 belonged to Independents, 1163 to Baptists, 1317 to Wesleyan Methodists (including 673 of the original connection, and 233 Primitive Methodists), 626 belonged to Roman Catholics, 168 to Unitarians, 166 to Scottish Presbyterians, and 272 to Calvinistic Methodists.

15,979 places of meeting for public worship in England and Wales were on the register on 31st December 1866, and the following is a list of the various titles by which the religious denominations have been certified to me.

Apostolics.
Armenian New Society.

Wesleyan Reform Glory Band.

Re-marriages.—26,128 widowers and 17,651 widows re-entered the marriage state during the year; of the widowers 16,467 married spinsters and 9661 married widows; the remaining 7990 widows were allied to bachelors.

Marriages of Minors.—12,569 men and 37,610 women married under the age of 21 years; of men, the proportion who married under age, was 6·69; of women 20·03 in 100. The prevalence of early marriages differs considerably in the several counties, and is always greatest in those

centres of industry which afford employment for young persons; thus the early marriages of straw plait and lace makers raise the proportion of men to 11·5 and women to 24·2 per cent. in Buckinghamshire, and to 11·7 men and 25·7 women per cent. in Bedfordshire; in Leicestershire the proportions are 11·6 men and 23·5 women; Nottinghamshire, 10·4 men and 23·1 women; in Durham, 7·9 in every 100 men, and 30·2 in every 100 women marry under the age of 21. In London the proportion of early alliances is always small, owing, among other causes, to the cost of house accommodation, and the more exacting requirements of social position; 3·5 in 100 men and 14·3 in 100 women married under age in the metropolis.

Signature of Marriage Registers.—Of the 187,776 men and 187,776 women who married during the year 1866, 40,609, or 21·6 per cent. of men, and 56,395, or 30·0 per cent. of women signed the registers with marks. High as these proportions are it is nevertheless gratifying to observe that a progressive decrease is shown in the returns. Twenty years since one third of the men and half of the women were unable to attach their names to the record of their marriage. Examined by the test of the marriage registers the women in most of the agricultural districts appear to have had a better elementary education than the men, while the reverse is the case in the manufacturing and mining districts, and also in Wales, where little more than half the women write their names. In the following counties the women sign their names in a greater proportion than the men, viz., Surrey, Kent, Sussex, Berkshire, Middlesex, Hertfordshire, Oxfordshire, Huntingdonshire, Essex, Suffolk, Norfolk, Wiltshire, Dorsetshire, Somersetshire, Herefordshire, Rutlandshire, and Lincolnshire.

Scotland compares very favourably with England in elementary education, as represented by marriage signatures, although little or no progress is shown in this respect; for while 11·4 in every 100 men and 22·2 in every 100 women signed the registers with marks in Scotland in 1865, the respective proportions in 1855 were 11·4 and 22·8; in England the

42	Monmouthshire	·904	63·2	54·0	7·09	22·63	13·35	10·80
43	South Wales	·842	68·1	50·1	6·48	18·48	13·15	9·00
44	North Wales	·734	67·1	54·0	4·23	12·68	16·32	9·45

The Table may be read thus by omitting the decimal points:—In England, among every 100,000 persons living 885 marriages took place; of 1,000 men married 784, of 1,000 women 700, signed the marriage register by writing their names; of 10,000 men married 669 were not of full age, of 10,000 women married 2003 were not of full age; of 10,000 men married 1391 were Widowers, of the same number of women married 940 were Widows.

1865 from 1·2 per cent. of men and 6·3 per cent. of women in Orkney to 33·8 per cent. of men and 47·5 per cent. of women in Ross and Cromarty.

The marriage returns of Ireland show that nearly half the adult population do not write their names. In 1866 42·4 in every 100 men and 52·4 in every 100 women signed the marriage register with marks; in 1865 the proportions were 43·6 in 100 men and 53·7 in 100 women.

In France the registers of 1866 show that, without distinction of sex, 33·42 in every 100 persons failed to attach their names to the marriage records; in England for the same year the mean of the two sexes was 25·8 per cent.; in Ireland 47·4; and in Scotland (in 1865) 16·8 per cent.

The proportion varied in the departments of France from 1·44 per cent. in Bas-Rhine to 74·48 per cent. in Haute-Vienne. There were 20 departments having a lower rate than 15 per cent. signing with marks, 13 departments having a rate of 15 and under 30 per cent., 18 having a rate of between 30 and 40 per cent., 17 having a rate of between 40 and 50 per cent., and 21 with a rate of 50 per cent. and upwards.

Births.

In 1866 the births of 753,870 children were registered; 384,955 were boys and 368,915 were girls. These numbers do not include the still-born, which are not registered. The births exceed those of the previous year by 5801, but the proportion to the population, although high, is somewhat less than in the two previous years. In 1866 there were 3·554 births to 100 persons living, or one birth to every 28 of the population; in each of the two previous years the rate was 3·564 per

* These are chiefly chapels of the "Wesleyan Methodist Free Church."

cent.; the average rate since the commencement of registration is 3·357 per cent. In each of the last eight years the birth-rate has been considerably above the average.

As in previous years, Durham exhibits the highest birth-rate (4·337 per cent.), while, as hertofore, Herefordshire has the minimum rate (2·878 per cent.); in London the rate (3·577 per cent.) is somewhat in excess of that of England generally.

Sex.—Males were born to females in the proportion of 104·3* to 100; this proportion is remarkably uniform in each year in England, the average of 10 years being 104·5, and it is never less than 104 males to every 100 females. The proportion of the sexes varies somewhat in different counties, thus, on an average, it is highest, 106·2 males, in North Wales; Huntingdon next follows, with a proportion of 106·1 males; then follow Norfolk, 105·8; Cornwall, 105·8; Leicestershire, 105·8; Northumberland, 105·8; Monmouthshire, 105·8; and Suffolk, 105·7. The lowest average proportions are in Buckinghamshire, 102·8; Hertfordshire, 102·9; Berkshire, 103·2; North Riding of Yorkshire, 103·6; and London, 103·7.

Taken by groups, the average proportion of males born to females is highest in the northern counties, 105·3; then follow the eastern counties, 105·2; Monmouthshire and Wales, 105·1; north-western counties, 104·7; south-western and north-midland groups each show an average of 104·6; south-eastern counties, 104·5; south-midland counties, 104·5; Yorkshire 104·2; and the west-midland counties 104·1 males to every 100 females born. Examined year by year the proportion in each county varies, by a law well known to those versed in the doctrine of chances, in proportion to the extent of the facts; thus, in Rutlandshire, where the annual number of births is only about 700, the proportion of the sexes born varied from 114·6 males to every 100 females in 1864 to 97 males to 100 females in 1862. Of ten consecutive years the males born in this county exceeded

* The proportion of sexes born is a subject of interest, and authentic information on the law prevailing among different animals would furnish a valuable contribution to physiology.

the females in five years, and in the remaining five years the females born exceeded the males; the average of the period, however, exactly coincides with that for England, and shows a proportion of 104·5 males born to every 100 females. In Staffordshire, Warwickshire, Lancashire, and Yorkshire, where the number of births is large, the yearly variation in the proportion is less observable.

In Scotland and in Ireland the proportion of males born is higher than in England, thus, in the year 1866 there were 104·3 males to every 100 females born in England, 105·9 in Ireland, and 105·7 in Scotland.

In France the returns during the 44 years, 1817–60, show that there were 106 males born to 100 females.

Seasons.—In the first quarter of the year 196,753 births were registered, in the second quarter 192,427, in the third quarter 179,096, and in the last quarter 185,594. If the average number of births in a quarter be represented by 1000, then there were in the first quarter 1058, in the second 1023, in the third 942, and in the last quarter 977: these proportions are higher than usual in the first and last quarters, and lower in the second and third quarters of the year.

Children born out of Wedlock.—The number of illegitimate births registered was 45,501, of which 23,285 were births of males and 22,216

land shows the high illegitimate birth-rate of 11·5 out of every 100 children born, in Norfolk it was 10·3, Westmorland 9·7, Herefordshire and Nottinghamshire 9·1, Shropshire and the North Riding of Yorkshire 8·9, and in Bedfordshire 8·2. The lowest rates were in London and counties immediately surrounding, thus it was in Middlesex 3·8, London 4·1, Surrey 4·2, Kent 4·5. In Durham there were 4·9 illegitimate births in every 100, in Warwickshire and Monmouthshire there were in each 5·0, in Huntingdonshire 5·1, Essex 5·2, and in Gloucestershire 5·3.

In Scotland in the year 1866 the illegitimate birth-rate was 10·1 in every 100 births; it was higher (10·5) in the rural than in town districts (9·9); the rate varied from 16·1 per cent. in Banff and Aberdeenshire to 4·5 in Sutherland and Shetland.

The proportion of males to females born is higher amongst illegitimate births than amongst the legitimate, although from being fewer in number they exhibit in different years greater variation in the proportion of the sexes than is shown in the case of legitimate children; there were thus 106·3 males to every 100 females in England born out of wedlock in 1863, while in 1860 the proportion was 102·9. On an average of the 10 years, 1857–66, there were of illegitimate children 104·8 males to 100 females born, while during the same period there was an annual average of 104·5 males to every 100 females born *in* wedlock. In the year 1866 there were 104·8 males to 100 females born *out of* wedlock, and 104·3 males to 100 female children born *in* wedlock.

TABLE **15.—Annual Rate of Mortality** of Males and of Females in **England, 1838–66.**

Average of 29 years, 1838–66	2·332	2·154	103	108

The Table may be read thus:—In the year 1838 to every 100 males living there were 2·342 deaths of males; to every 100 females living there were 2·146 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males* and *females;* and that out of equal *numbers living* the deaths of males were 109 to every 100 deaths of females in 1838.

DEATHS.

In 1866 the population of England had grown to twenty-one millions; and with it had grown to proportionably great dimensions that conscription in the registers of mortality to which each individual life, by a supreme law, makes its inevitable contribution. The number of deaths

44	North Wales	1·894	1·938	2·026	2·047	2·225	2·098	2·189	2·171	2·214	2·207	2·101	2·365

registered in 1866 was about half a million. It is sufficiently near the truth, as a general statement, to observe that in the series of years, 1838–66, population, marriages, births, and deaths have attained numerical values each greater by half than that which had been attained at the beginning of that period. The number of deaths of males in 1866 was 256,402, of females 244,287 ; the total 500,689.

The rate of mortality in 1866 was 2·361 per cent. of population against an average of 2·224. The year 1860 was healthy, and its death-rate was but little above 2·1. In the two subsequent years it was still below 2·2. In the four succeeding years the death-rate rose above 2·3. Although cholera prevailed in London, Liverpool, Swansea, Neath, and other places in 1866, the mortality from all causes exceeded in no remarkable degree the average in the third quarter, and was hardly above it in the fourth. If that epidemic had not been in England, the latter half of the year would have been comparatively healthy in succession to an unhealthy spring.

In the healthiest year of the series, 1838–66, which was 1856, there was one death to 49 persons living ; in the two healthy years 1845 and 1850 there was one to 48 ; in the three years 1843, 1860, and 1862 there was one to 47 ; the last four years were unhealthy, and one death has occurred out of every 42 or 43 persons living. The deaths registered do not include those of still-born children.

Seasons.—In the winter quarter (ended 31st March) the deaths were 138,136. In the spring quarter (ended 30th June) 128,551. In the summer quarter (ended 30th September) 116,650. In the autumn quarter (ended 31st December) 117,352.

If the deaths in the year had been 1000, and the same proportions maintained as above, the numbers would have been in the successive quarters 276, 257, 233, and 234.

* For mode of reading this Table, see Note to Table 18.

NOTE.—The Population used in the above calculations is now deduced from the ascertained rate of increase observed in the 20 Years 1841-61.

The annual rate of mortality in the March quarter was 2·652 per cent. against an average of 2·510; that of the June quarter 2·434 (average 2·229); of the September quarter 2·179 (average 2·052); and of the December quarter 2·187, almost identical with the average 2·182.

Violent gales and a severe but transient snowstorm attended the first days of the year; thaw quickly came, and was followed by heavy rains and high winds, with a temperature unusually high, which continued till the middle of February. The average excess of temperature was 6° daily up to the 12th of that month. A period of cold followed, which lasted 30 days. Again four days of warm weather in the middle of March were succeeded by four days of very cold weather; and finally there were eight days of high temperature, 6° above the average, and closing a winter which, with its sudden and severe alternations, could hardly fail, it might be supposed, to affect the public health unfavourably. But the mortality rose in the Lancashire and Yorkshire towns, not in the open southern counties, from scarlatina, measles, whooping-cough, and other complaints of the zymotic character. Fever raged in Liverpool and raised

The Table may be read thus:—Of 100 males living of the age 35 and under 45, 1·358 died in 1838, 1·265 in 1839, and 1·162 in 1850; the average annual rate in the 29 years, 1838-66, among the aggregate of males in this decennial period of age was 1·298.

the mortality to 4·6 per cent. The mortality of England, as has been shown, was above the average in the first quarter.

After the warm weather came a period of cold, which lasted nine days, when the thermometer was frequently below freezing point. Nineteen days of great heat succeeded, and produced an almost instantaneous effect on vegetation, leaves and blossom shooting as if by magic. On 29th April another cold and ungenial period set in, when the thermometer often fell below freezing point; it lasted throughout May, destroying blossom and retarding the crops. Again the weather changed, and was much warmer for 10 days in the beginning of June; then for the next 10 days another cold period, followed by warmth till the close of the quarter. Such vicissitudes were fatal everywhere, but chiefly in towns. The mortality of spring was much above the average.

All the three months of summer, but particularly August, were cold. The first week in July was cold; from the 9th to the 17th July there was heat; and from the latter date to the 27th September the temperature was almost constantly low. Rain was frequent in July and August, excessive in September. There were great floods in the midland counties. Such weather occurring in the hot season was probably salutary; it may have checked the progress of cholera, and thus restrained within narrow limits the excess of mortality shown above.

The meteorological conditions of the last quarter were very favourable to health. All the three months were warm; December was unusually mild; and the mortality fell to its autumnal average.

Sex.—It has been stated that the absolute number of deaths was rather more than 500,000. Of those thousands, omitting the odd figures, 256 were males, 244 females; the deaths of males being, as usual, in preponderance. For every hundred females there were 105 males. This exceeds the average proportion which may be stated as 103. But in the population as constituted the female element predominates. If it had been otherwise; if the two constituent elements had possessed the same numerical strength, the rate of mortality in males is so much higher than

that of females, that 112 males would have died for 100 females; the average proportion under the assumed condition being 108.

Death-rates in counties, and in town and country.—In none of the counties was the mortality so high as in Lancashire, where, taking the better with the worse parts, it was 3·016 per cent. against an average of 2·597. In all other counties it was under 2·70 per cent., having ranged in these from 1·74 in Westmorland and Herefordshire, and 1·78 in Rutlandshire to 2·68 in the West Riding of Yorkshire. In Northumberland the death-rate was 2·577 against an average of 2·240; in Cheshire 2·538 against 2·236. In the following counties and extra-metropolitan portions of counties it was 1·82 per cent., and under 2·00, Surrey, Huntingdonshire, Hertfordshire, Dorsetshire, Suffolk, Wiltshire, Lincolnshire, Cornwall, Sussex, Kent, Oxfordshire, Northamptonshire, Buckinghamshire, Shropshire, Hampshire, and Worcestershire. The rate of mortality in the metropolis was 2·648 against an average of 2·359 per cent. London, within whose bounds are grimy districts covered with dense populations, and parks or suburban fields adorned with terraces and villas, produces an annual rate of mortality, which on the average corresponds very closely with that which is attained in the West Riding of Yorkshire, with its busy manufacturing towns, and its tracts of clear, open country.

If ten English towns are selected for comparison, it will be seen that the borough of Liverpool was the most unhealthy in 1866; for by a malignant fever in winter, and cholera in summer, the mortality of the year was raised to 4·185, while that of Manchester was 3·195. In the summer quarter cholera raised the death-rate of that borough to 5 per cent.

Ages.—Of 256,402 deaths of males at all ages, 108,424 occurred under 5 years of age, of which 66,851 were those of children who had not completed their first year of existence. In the period of life 5–15 years the deaths of males were 15,117; at 15–25 they were 15,010; at 25–35 they were 16,328; at 35–45 they were 17,463; at 45–55 they were 18,940; at 55–65 they were 20,894; at 65–75 they were 22,711; at 75–85 they were 17,068; at 85–95 they were 4249; while 198 men died at the age of 95 years and upwards. Starting from the age of five years, it appears that the absolute numbers in the first two decennia were almost equal; in the next and following decennia they constantly increased up to 75 years, at which age the males living had become so few, *rari nantes in gurgite*, that the deaths, notwithstanding an increased rate of mortality, became less numerous absolutely than in the three previous stages.

Of 244,287 deaths of females, 94,595 occurred under 5 years of age, of which 53,448 were those of infants less than one year old. In the decennium 5–15 years 14,200 girls died; in the next 15–25 years, 15,805 women died; at 25–35 years, 17,454; at 35–45 years, 16,940; at 45–55 years, 16,258; at 55–65 years, 19,176; at 65–75 years, 23,426; at 75–85 years, 19,958; at 85–95 years, 6059; and at 95 years and upwards, 416 nonagenarians and centenarians died. Thus, after the age 5–15 there was an increase up to the period 35–45; then in two decennia a decrease; then in the two following decennia an increase; at 75–85 a decrease, which continued with increasing rapidity towards that extreme point of age where all human life, that is mortal, is extinguished.

1866	125,172	1000	1118	1029	924	929

The death-rate of males at all ages was 2·496 per cent. in the year 1866; the mean of twenty-nine years being 2·332. The mortality of boys under 5 years (7·381 per cent.) was above the average; in the two quinquennia 5–10 and 10–15 years, and in the decennium 15–25, the mortality was below the average; in the next period 25–35, it was 1·168 per cent., the mean being ·989; and it continued to increase, and also to be above the average, in each successive decennium. In the period 65–75 the death-rate was 7·838 per cent., the mean being 6·818; at 85–95 it was 34·264 against 30·763, and at 95 and upwards, 48·710, while the mean was 44·430 per cent.

The death-rate of females was 2·234 per cent., the mean of twenty-nine years being 2·154. In the first quinquennium the mortality of girls was, like of that boys, above the mean rate. Between 5 and 25 years the mortality was, as also in the males, below the mean. In the subsequent ages up to 65 years it was above the mean; but thereafter did not, like the mortality of males, discover a decided tendency to maintain itself above the average.

In all the successive stages of life, as fixed in the Tables, the rate of mortality in males was above that of females, except the age 15–25, when the mortality of females was slightly higher. In the stage 55–65 the male and female death-rates made a close approximation.

Mean –	3·525	3·492	3·221	3·196	2·510	2·229	2·052	2·182

The Table may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 3,032 births, and 2,615 deaths registered. The three months January, February, March, contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

The United Kingdom.

The Population of Great Britain and Ireland was (as estimated for the middle of 1866) 29,946,058, who lived on an area consisting of 77,286,901 acres. The marriages amongst these thirty millions in that year were 251,606; the births 1,062,492; the deaths 688,960. People were married at the rate of 1·680 per cent. of population; children were born at the rate of 3·548; persons died at the rate of 2·301 per cent.

In the United Kingdom there were about two acres and a half to every individual. In England and Wales the proportion is one person to 1·76 acres; in Ireland one to 3·64; in Scotland the density is little more than half as much as it is in Ireland, the proportion being one person to 6·23 acres.

The marriage-rate in Scotland (persons married, to population) was 1·498 per cent.; in Ireland 1·440. The marriage-rate in England was considerably higher than in either, namely 1·770 per cent.

The birth-rate of Scotland was higher than that of England; and its death-rate was lower (2·260 against 2·361). The returns of Ireland for this year are evidently defective.

Foreign States.

The populations of France and of Austria (under which are included Hungary, Croatia, Slavonia, and Transylvania) do not differ greatly in amount. The former contained in 1866 thirty-eight millions of people; the latter thirty-five millions. The per-centage of the married was 1·584 in France, 1·458 in Austria; both decidedly lower than that of England.

Table **23.**—Estimated **Population, Marriages, Births,** and **Deaths** in the **United Kingdom,** in the Year **1866.**

	Area in Statute Acres.	Estimated Population in the middle of the Year 1866.	Marriages.	Persons Married.	Births.	Deaths.
United Kingdom	77,286,901	29,946,058	251,606	503,212	1,062,492	688,960
Great Britain	56,964,260	24,363,433	211,405	422,810	867,509	571,962
England and Wales	37,324,883	21,210,020	187,776	375,552	753,870	500,689
Scotland	19,639,377	3,153,413	23,629	47,258	113,639	71,273
Ireland	20,322,641	5,582,625	40,201	80,402	194,983	116,998

Note.—The *registered* Marriages, Births, and Deaths for Ireland were 30,151, 146,237, and 93,598 respectively. These numbers have been corrected in the above table for defective registration. As regards the marriages and births, one third has been added to the registered numbers and a fourth part has been added to the registered number of deaths.

Table **24.**—**Proportion** per Cent. of **Marriages, Births,** and **Deaths** to the Population of the **United Kingdom,** in the Year **1866.**

	Acres to a Person.	To 100 Persons Living.			
		Marriages.	Persons Married.	Births.	Deaths.
United Kingdom	2·58	·840	1·680	3·548	2·301
Great Britain	2·34	·868	1·736	3·561	2·348
England and Wales	1·76	·885	1·770	3·554	2·361
Scotland	6·23	·749	1·498	3·604	2·260
Ireland	3·64	·720	1·440	3·493	2·096

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the "density" of the population, or the population to each acre, square mile, or other measure.

To whatever cause it is to be referred, the returns of births and population of Austria show a very high birth-rate; in 1866 it was 4·034 per cent.,

	AREA IN STATUTE ACRES.							
—	226,684		180,000		28,717		17,967	

Note.—The above numbers have been compiled from returns furnished to the Registrar-General by Lieutenant-Colonel J. F. Murray, Government Secretary of Jersey, Lieutenant-Colonel W. Bell, Government Secretary of Guernsey, &c., and by Mr. J. T. Clucas, Clerk to Council and Secretary to Lieutenant-Governor of the Isle of Man. The returns for Guernsey and adjacent islands are imperfect owing to certain denominations neglecting to register the births and deaths.

* The increase in the number of deaths in each of the years 1864–66 is attributable to the prevalence of fever and small-pox. The Island is visited by a considerable number of persons, and it is estimated that on 1st August 1867 there were 64,000 persons on it.

† The decrease of population in 1867 is confined to Alderney, and is attributed to the discharge of men from the Government works.

TABLE **26.—Estimated Population** of **England, France,** and of **Austria, 1853** to **1866.**

1866	21,210,020	38,067,064†	35,065,949

* M. Legoyt, director of the Statistical Department of France, has favoured the Registrar General with the returns of France for the years 1853–61 and for the year 1866. The population in the four years 1862–65 has been estimated by means of the average annual rate observed between the two enumerations of 1861 and 1866.

† Including the three newly annexed departments.

‡ Dr. Ficker, chief of the Statistical Department of Austria, has favoured the Registrar General with the returns of Austria. The population returned above includes Hungary, Croatia, Slavonia, and Transylvania. The population of the States of Italy are excluded throughout.

TABLE 27.—Number and Proportion per Cent. to Population of Marriages, Births, and Deaths in England, France, and in Austria, 1853–66.

(The returns relating to France are supplied by M. LEGOYT, Director of the Statistical Department of France. Those relating to Austria are supplied by DR. FICKER, Chief of the Statistical Department of Austria.)

* The returns for France in the years 1861 to 1866 include the three newly annexed departments. The deaths of Frenchmen abroad—civil or military—are registered in the books of the commune in which was their last domicile. M. Legoyt has revised the population and the numbers of marriages, births, and deaths for the years 1853–65.

†The returns for Austria include Hungary, Croatia, Slavonia, and Transylvania, and exclude the States of Italy. For the years 1860-63, and 1866, the numbers for Hungary and its annexed territories have been estimated.

‡ In France in 1865 and 1866 cholera was prevalent.

which is much higher than the English rate, 3·554, and conspicuously higher than the French, which is 2·612 per cent.

The birth-rates of Italy and Spain were respectively 3·862 and 3·703 per cent., both higher than the English rate, and show a superiority only too striking over that of France.

Austria which is low in its marriage-rate, and high in its birth-rate, showed a death-rate higher considerably than the rates of England and France; it was 3·232 per cent. against 2·326 the French death-rate in 1866, which latter was rather lower than the English. The death-rate of the Italian kingdom was 2·896; that of Spain 2·805, both contrasting unfavourably with those of England and France.

TABLE **28.—Italy. Population, Numbers,** and **Proportions per Cent.** of **Marriages, Births,** and **Deaths, exclusive of still-born,** in each of the Years **1862** to **1866.**

1866 (exclusive of Venetia.)	22,703,135	120,752*	241,504*	876,917	657,452	·532*	1·064*	3·862	2·896

NOTE.—The Returns of Births and Deaths in the year 1862 included the *still-born*, and as no *separate* return of them was made in that year the numbers returned as still-born in 1863 have been deducted from the Births and Deaths for the year 1862.

* The new law which in 1866 removed civil registration from the parochial authorities to the communes, caused a marked decrease in the number of Marriages. Although the decrease is generally attributable to this cause it should be stated that a large number of Marriages were contracted in the previous year, in order to evade the law which was about to come into operation. On the other hand it should not be forgotten that in 1866 many of the Marriages continued to be celebrated at church without being registered, and are consequently not taken into account in the statistical department.

TABLE **29.—Spain. Population, Numbers** and **Proportions per Cent.** of **Births** and **Deaths** in each of the Years **1861** to **1866.**

1866	1·264	1·549

Ireland, of whom the large proportion of 24,238 was stationed in the latter country. Within the term "men" are also classed non-commissioned officers.

The proportions of military force in the three Kingdoms, to civil population were: England and the Channel Islands 26; Scotland 11; Ireland 43 to 10,000.

In the United Kingdom 49 officers and 1007 men died in 1866. The mortality of officers was 1·096 per cent.; that of men 1·264. The mortality of officers was less in Great Britain than in Ireland; but amongst the men it was higher in Great Britain than in the sister island.

Abroad there were 6252 officers and 111,265 men. The number of soldiers was less by about 15,000 than the number abroad in 1864, and less by about 7000 than the number in 1865.

1858	7,363	4,275	3,486
1859	4,150	2,409	1,965
1860	3,293	1,912	1,559
1861	3,097	2,042	1,760
1862	2,544	1,677	1,445
1863	2,209	1,457	1,255
1864	2,493	1,644	1,417
1865	2,578	1,700	1,465
1866	1,802	1,188	1,024

The number of Deaths in the cols. 3 and 4 were estimated on the assumption that the soldiers abroad belonged to the different parts of the British Empire in the proportions indicated in the Table 36.

TABLE **38.—Austria. Annual Rate of Mortality** per Cent. in the **Army** in each of the Years **1857–66.**

YEARS.	ESTIMATED STRENGTH.	DEATHS.	ANNUAL RATE of MORTALITY per Cent.
1857	379,374	8,646	2·279
1858	347,696	8,577	2·467
1859	527,772	16,638	3·152
1860	384,302	11,903	3·097
1861	459,300	8,763	1·908
1862	400,895	6,800	1·696
1863	467,154	5,811	1·244
1864	559,599	6,928	1·238
1865	552,148	5,261	·953
1866	646,636	11,942	1·846

Seventy-nine officers and 1723 men died abroad in 1866. The mortality was remarkably low; that of officers was 1·264 per cent. against 1·576 in the previous year; of men 1·549 against 2·102 in 1865. This satisfactory improvement in the health of the army abroad is apparent, also, when the comparison is made with earlier years; and it furnishes interesting matter of inquiry in regard to the circumstances from which it sprung. The mortality of the Austrian army was 1·846 per cent. in 1866, the year when disaster befell the arms of that powerful empire.

Births and Deaths of British Subjects at Sea.

The number of seamen at sea in merchant ships in 1866 was 196,371; and of that number 4866 died in the same year. These figures represent a mortality of 2·58 per cent., which is higher than that of any previous year within the limits of the returns.

The mercantile marine strength had an evident increase in 1863; there was a further great increase in the following year; and in 1866 the accession, that had been acquired, was fully maintained.

Table **39.—Number of Births and Deaths of British* Subjects at Sea,** exclusive of Soldiers, Marines, invalided Seamen from the Royal Navy, and Seamen on Ships' Articles, in the Years **1856–1866**, reported by the Captains or Commanding Officers of Vessels to the Registrar General of Seamen at the Termination of their respective Voyages in Ports of the United Kingdom.— (Furnished to the Registrar General by the Registrar General of Seamen.)

	Total	3,710	2,247	5,957

* British *subjects* are not particularly described in these returns, but foreign names have been excluded. A column headed *Place of Birth* was formerly contained in these returns, for the purpose of distinguishing passengers as British subjects or Foreigners, but in many cases it was not filled up by masters, in consequence of their inability to obtain the information after the death had taken place. British and Foreign *seamen* are distinguished.

† The deaths of soldiers, marines, and seamen from the Royal Navy, who were passengers in British Merchant Ships, were 33 in 1856, 59 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, 122 in 1862, 116 in 1863, 96 in 1864, 140 in 1865, and 184 in 1866. The number is 1367 in eleven years, which, if added to the 5,957 above, makes 7,324, the total number of deaths of British subjects at sea in 1856-65, exclusive of those of merchant seamen.

The number of births at sea was 415 of which 213 were of boys, 202 of girls. The deaths at sea of British subjects, exclusive of soldiers and sailors, were 1053, of which 690 were those of males, 363 those of females.

ABSTRACT of a RETURN, which was ordered by the HOUSE OF COMMONS, 2d April 1867, of the Number, Ages, Ratings, and Causes of Death of SEAMEN, reported to the REGISTRAR GENERAL of Seamen as having died in the BRITISH MERCHANT SERVICE in the year 1866.

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Seamen. This return does *not include seamen dying ashore in foreign parts*, whose wages and effects are delivered to the consuls or officers of the hospitals to which such men are sent; accounts of their effects are sent direct to the Board of Trade.

If a seaman dies on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel is not to return direct to the United Kingdom. But if a *passenger* dies on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred. In some passenger-ships women are employed as stewardesses, and are counted as part of the crew. They therefore form part of the strength in this Table, and if the death of a stewardess occurs in the course of a voyage, it is included in the column of Deaths.

When a ship is lost with all persons on board, the owners return the number and names of the crew, and the names of the passengers, when known, to the Registrar-General of Seamen.

Marine Register Book.

It is required by the Registration Act that captains or commanding officers of British vessels should transmit to me the particulars of all births and deaths of English subjects that occur at sea. In 1866 only 74 births and 184 deaths were reported for entry in the Marine Register Book, which is kept at this office.

Names on the Registers, and Searches.

At the end of 1866 the number of names inscribed in the registers kept under the Registration Act, 6 & 7 Will. 4. c. 86. had reached 38,833,752, the addition for the year having been 1,630,111 names. An alphabetical Index referring to the names entered in the registers is prepared for each of the four quarters of the year as soon as practicable after the certified copies are received at this central office and subjected to a strict examination, with a view of detecting errors and informalities admitting of correction or explanation. By means of the general Indexes the entry of any birth, death, or marriage which has been registered since 1st July 1837, can generally, on a mere mention of the name, without a precise statement of the date or locality, be very soon discovered, and a certificate given.

The rapidly increasing bulk of the Indexes, to which more than 1,600,000 names are annually added, the limited space in the present Public Search Room of this office, and other considerations connected with the convenience of the public in making searches, have led to the adoption of an important change in the manner in which part of this great national work is carried out. It appeared to me highly desirable that the Indexes, instead of being prepared and exhibited to the public in manuscript, should be printed. Printing is more accurate than copying by hand; printed Indexes too occupy much less space; while additional copies can be

---

Note.—The numbers registered in 1837 are for the Half Year ending December 31st.

obtained at a trifling cost; moreover, printed columns of names can be referred to with greater ease than manuscript. With the assistance of the Comptroller of Her Majesty's Stationery Office, I have been enabled to carry out the arrangements for effecting this change; and the quarterly Indexes from the commencement of 1866 have been printed, with the utmost regard to accuracy and punctuality, by Messrs. Eyre and Spottiswoode, six copies being now produced at little more than the former cost of one. I may add, that the persons who make use of the volumes for searches, constantly express their satisfaction with the new printed Indexes.

The number of searches for registers at the CENTRAL OFFICE continued to increase during 1866. In the indexes prepared under the Registration Act 10,970 searches were made, and 9145 certificates were given; the searches for non-parochial registers were 1153, and the certificates granted 862. The total amount received in fees for searches and certificates, and paid into the Exchequer was 1,860*l.* 15*s.* 6*d.* The numerous searches for registers of births for purposes connected with the Factory Acts being made without charge are not included in the above.

The following are the registers and records deposited in my custody at this office, now exhibited to the public on payment of the statutory fees, viz., 1*s.* for search, and 2*s.* 6*d.* for certificate or certified extract:—

1. REGISTERS OF BIRTHS AND DEATHS registered in England and Wales on and after 1st July 1837.
2. REGISTERS OF MARRIAGES registered in England and Wales on and after 1st July 1837, after solemnization in Churches of the Established Church, in registered Roman Catholic and Dissenting Places of Worship, and in District Register Offices; also of Quakers and of Jews.
3. REGISTERS OF BIRTHS AND DEATHS AT SEA registered since 1st July 1837.
4. NON-PAROCHIAL REGISTERS OF BAPTISMS or Births, BURIALS or Deaths, and (in a few instances) of MARRIAGES, being the Registers or Records kept by various bodies and congregations of Nonconformists prior to the general system of registration commenced in 1837;—comprising amongst others the Registers kept at *Dr. Williams' Library* from 1742; *Bunhill Fields Burial Ground* from 1713; the registers of *French Protestant and other Foreign Churches* in England; the registers of the *Society of Friends*, &c.
5. REGISTERS OF MARRIAGES of British Subjects in FOREIGN COUNTRIES, pursuant to the Act 12 & 13 Vict. c. 68. [The Marriages under this Act are those solemnized since July 1849, at British Consulates abroad.]
6. REGISTERS OF MARRIAGES IN INDIA, pursuant to 14 & 15 Vict. c. 40. [The Marriages under this Act are those solemnized since 1st January 1852, in the presence of Registrars in India; the Marriages by Clergymen of the Church of England are not included.]
7. REGISTER OF BUILDINGS CERTIFIED to the Registrar General AS PLACES OF RELIGIOUS WORSHIP (18 & 19 Vict. c. 81.)
8. RETURNS OF PLACES OF WORSHIP certified to Diocesan Registrars, Clerks of the Peace, &c. prior to 1st July 1852 (19 & 20 Vict. c. 119. s. 24.)
9. FLEET and MAY FAIR REGISTERS OF MARRIAGES.
10. REGISTERS OF BIRTHS AND DEATHS of British Subjects received from Her Majesty's Consuls and from other authorities in Foreign Countries.

For Certificates required for purposes connected with Government Insurances and Annuities, or for production to the Civil Service Commissioners, personal application is dispensed with.

The Report on the Causes of Death in England, addressed to me by Dr. Farr, will be found in the Appendix.

I have the honour to be,
Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

Summary of the Quarterly Reports, 1866.

First Quarter.—January, February, March.

The United Kingdom. — The Registers of the United Kingdom show that 110,440 persons married in the quarter that ended 31st March; and that the births of 265,717 children, and the deaths of 185,035 persons of both sexes, were registered in the same three months.

The death-rate of the United Kingdom differs little from that prevailing in England and Wales to be here discussed. The several facts concerning the other divisions of the Kingdom are fully set forth in the reports of the Registrar General of Scotland and the Registrar General of Ireland.

The estimated population in 1866 of England, Scotland, and Ireland is about 29,946,058. The corrected death-rate of the quarter is 2·600 per cent.

England.—The marriage-rate, which was low in 1861–62, but revived subsequently, and was remarkably high in 1865, continued to be well maintained in the first quarter of the present year. The natural growth of the population, as shown by the birth-registers, has been active for a considerable time; and it was well maintained in the first three months of the present year. Against this latter fact must be set the high mortality which prevailed during the same period, partly in consequence of meteorological conditions and changes, unfavourable to health.

Marriages.—In the March quarter 75,158 persons were married in England. The marriages were 37,579 against 33,427 in the same quarter of 1856. The number of marriages advances with the increase of population, but not without fluctuations that are attendant on the changing condition of the people, of which condition industrial success or adversity is perhaps the most appreciable, but not the only, element. At the beginning of the last decade the annual number of marriages was about 160,000; at the end of it the number returned in a year was more than 185,000.

The annual marriage-rate in the first quarter of the present year was 1·442 (viz. of persons married) to a hundred persons living. The average rate of ten March quarters was 1·40.

Births.—Of children born in the March quarter of the present year the number was 196,753, against the high number 194,130 in the corresponding period of 1865. The annual birth-rate for the same period was 3·776 per cent.; the average being 3·644. The birth-rate is always higher in the first six months of the year than in the last; but the tables for the last ten years furnish no instance of a rate so high as that which prevailed last quarter. London yielded its fair contribution to the increase; the births were under 30,000 in the metropolis, and about that number in Cheshire and Lancashire. In some counties, as Oxfordshire, Buckinghamshire, and Norfolk, there was a decrease, for which others, chiefly in the northern parts of the Kingdom and in Wales, more than compensated by their increase. The births were very numerous in Surrey, Devonshire, Lancashire, Durham, Northumberland, Cumberland, and Wales.

Increase of Population.—Whilst the births were 196,753, the deaths were in the same time 138,136, and the excess of the former over the latter was 58,617. The natural increase was 651 daily; but this was disturbed by migratory tendencies, always in active operation.

The total number of emigrants from ports in England, Scotland, and Ireland was 39,672, of whom about 11,000 were of English origin. Irish

emigration from the same ports was nearly double that amount. Of the total number 33,000 emigrants had chosen the United States for their destination, 6000 the Australian Colonies. Of the 21,000 Irish emigrants, 19,000 went to the United States.

Emigration declined greatly in the first quarter of 1865; but it has again increased, and was as active as in the two previous years 1863–64.

Prices, Pauperism, and the Weather.—The price of wheat continues to rise, and in the first three months of this year it was 45*s.* 6*d.* per quarter, which is five shillings more than it was in the same period of 1864, and seven shillings more than in that of 1865. During the four quarterly periods that have elapsed since the 31st March 1865, it has been slowly but constantly rising; it was 40*s.* 6*d.*, 43*s.* 3*d.*, 44*s.* 10*d.*, and 45*s.* 6*d.* Beef at Leadenhall and Newgate Markets, sold by the carcase, averaged $5\frac{5}{8}d.$ per lb., a price which differed but little from those of the March quarter in 1864 and 1865, which were $5\frac{1}{2}d.$ and $5\frac{3}{4}d.$ The price for inferior quality of beef was in all these three periods the same, viz. $4\frac{1}{2}d.$; for superior it was $6\frac{1}{2}d.$ in 1864, 7*d.* in 1865, $6\frac{3}{4}d.$ last quarter. The highest price of beef scarcely varied during the last eighteen months. The mean price of mutton was $6\frac{5}{8}d.$, and was rather higher than in the two previous corresponding quarters. Best potatoes at the Waterside Market, Southwark, ranged from 55*s.* to 90*s.* per ton.

The average number of paupers relieved on the last day of each week in the quarter was 139,541 in-door, 759,400 out-door. The amount of in-door relief was the same as in the March quarter of 1864, but rather less than that of 1865. The number of out-door paupers was less than it had been in either of those periods.

According to the Greenwich Observations the month of January was warmer than that month has been in any year since 1851. In ordinary course, January is almost 3° colder than December; but last January was as warm as the remarkably warm month that closed the year 1865. At the beginning of the month the weather was stormy, and the wind blew in gales; and on the 11th there was in London a fall of unusually heavy snow, which seriously impeded traffic and broke down the telegraphic poles and wires. Soon the snow disappeared under a rapid thaw, which was followed by the inundation of all the low-lying lands in the valley of the Thames. Heavy rains and high winds, with frequent changes, attended the month to its close; but its most striking feature was the high temperature, which continued till near the middle of February, and showed an average excess of 6° daily. From this date till the middle of March the air was almost continuously cold, and the average daily defect of temperature was about 3°. Four days of heat followed; then four days of cold; and finally a warm period of eight days, in which the mean temperature rose 6° above the average. The extreme mildness of the first six weeks quickened vegetation; hedges and fruit-trees budded, and in some places almost burst into blossom. The change in the atmosphere from mild and damp to cold and dry was favourable to agricultural operations, which had been in a backward state owing to the soddened state of the ground; and was besides a salutary check on the too rapid advance of vegetation; and at the end of the quarter the growing crops were sufficiently forward not to be injured by sudden frosts. The mean temperature of the air in the quarter was 41·2°, which is 1·7° above the average of the same period in the previous twenty-five years. The fall of rain was 9·3 in., which amount is 4·5 in. above the average. Less than two inches of that quantity fell in March; the rest in nearly equal portions in the two previous months. The atmospheric pressure was low throughout the quarter. The reporter at Guernsey states that in January the island was visited by a succession of storms, evidently recurrent cyclones; the most violent of which occurred on the 11th, raged with extraordinary fury, and inflicted extensive injury on trees and houses. The barometer fell to 28·444 in.,

the greatest depression known there for 23 years. At Aldershot on the 11th, snow covered the ground to a depth of 9 in.; and about the middle of the month snowdrops, crocuses, and primroses were in flower. On the 4th February a hurricane of unprecedented violence blew at Belfast and for many miles around it, accompanied with thunder and lightning, and with hail and rain which swept along in masses. "Large trees were "torn up; chimneys thrown down, and slates whirled through the air "like feathers." This storm visited Manchester and some other places in the north of England.

Deaths; and the State of the Public Health.—The weather in the quarter, as it was observed in the metropolis, has been described in its main points; and the description of it is for the most part applicable to that which was experienced over the country. It was unfavourable to health; and by exciting or aggravating pulmonary diseases carried off many persons of advanced age. The total number of deaths in England and Wales was 138,136, which implies a rate of mortality above the average of ten previous winters, though not so high as it had been in the winters of 1864 and 1865. In these two periods 142,977 and 140,646 deaths were registered.

It deserves to be noticed, that while the mortality in London and eight other divisions was lower last quarter than in the corresponding period of 1865, it was higher in the two remaining divisions, viz., the North-western Counties (Cheshire and Lancashire) and Yorkshire. It would appear that in the large and always unhealthy manufacturing towns in these parts, the people suffered more than they did in others from conditions and sudden changes of the atmosphere which were not confined to them; and also, as shown in the Registrars' reports, that scarlatina, measles, whooping-cough, and other zymotic diseases prevailed there, and co-operated with the weather in producing a high mortality.

The population of London is not very different in amount from that of Cheshire and Lancashire; the births were as 28 in the former to 30 in the latter; but the deaths were as 20 to 26.

The annual rate of mortality last quarter in England was 2·652 per cent.; the average of ten previous winters being 2·50. But it is a remarkable circumstance that this excess above the average was contributed entirely by the large towns; for in the country districts the death-rate, 2·252, was actually lower than the average, 2·295. The annual rate of mortality in the 142 town districts was 2·967 against the average, 2·68. These results confirm the conclusion that there were other destructive causes at work besides unfavourable states of the weather — that the diseases above mentioned, which commit so much havoc in towns, were still more extensively fatal, and only acquired additional vigour from influences peculiar to the season.

The death-rate was higher in Cheshire and Lancashire than in any other of the eleven divisions; it was 3·384 per cent. In Yorkshire it was 2·960; in London 2·666; in the West Midland Counties 2·654; in the Northern Counties (Durham, Northumberland, &c.) 2·443. It was lowest in the South-eastern Counties, where it was 2·185.

If the map of England were shaded to represent the rates of mortality of last quarter in the registration districts, the eye, travelling from the lighter south to the darker north would be instantly drawn to a spot of portentous darkness on the Mersey; and the question would be asked whether cholera, the black death, or other plague, imported with bales of merchandise, had been lately introduced into its busy and populous seaport. Happily this has not been the case; but fever, probably developed or aided by the mild and damp atmosphere of the season, and by overcrowding in an increasing population, has been busy and fatal in Liverpool, and in other towns of the same county, and of Yorkshire. The annual mortality of the borough of Liverpool in the three months was

excessive, and demands immediate and earnest consideration; it rose to 4·593 per cent. This implies that if this death-rate were maintained for a year, forty-six persons out of a thousand in the population would die in that time, or fifteen more than died in Glasgow, its northern rival, nineteen more than in London. The mortality of the city of Manchester, though far less than that of Liverpool, was higher than in any other of the thirteen selected towns of the United Kingdom; it was 3·742 per cent., and that of Leeds was hardly less. The following numbers of deaths registered in a few DISTRICTS in three corresponding quarters, make the recent increase sufficiently apparent:—

	March quarter 1864.	March quarter 1865.	March quarter 1866.
Liverpool	3013	3053	3521
West Derby	2136	2047	2626
Chorlton	1393	1196	1504
Manchester	2255	2313	2498
Ashton	779	836	1006
Oldham	673	853	1108
Blackburn	892	941	1148
Leeds	1088	961	1234

The Registrar of the Howard-street sub-district of Liverpool reports 33 deaths from typhus out of 330 from all causes; and many occurred from bronchitis and whooping-cough. In the St. Thomas sub-district of the same town 28 were from typhus out of 311; and pulmonary diseases were fatal. In the Mount Pleasant sub-district, in which the workhouse is situated, out of a total number of 1046 deaths, 215 were caused by typhus; 112 by bronchitis, 143 by phthisis, 26 by whooping-cough, 23 by measles, 19 by scarlatina. The Registrar of the Islington sub-district of Liverpool believes that overcrowding is amongst the causes of a high mortality. At Warrington there were 287 deaths, and no less than 94 of these were from measles. Typhus has been for some time very fatal in Manchester: it is stated by the Registrar of Deansgate that in the quarter ending 31st December 1865, not less than 1530 persons were attacked by continued fever in Manchester and its suburbs, and of these 155 died; and the disease has continued to prevail during the last quarter. In the sub-district of North Leeds, in a total mortality of 570 deaths, 79 were returned as caused by fever. It prevailed also fatally in Newcastle-on-Tyne.

Some further observations by Mr. Leigh, the Registrar of Deansgate, Manchester, on the smoke of that city, and its effects on health, will be read with interest.

On the CAUSES of the VITIATION of the ATMOSPHERE of MANCHESER, by JOHN LEIGH, Esq., M.R.C.S., Registrar of the Sub-district of Deansgate, Manchester. (*Continued from Twenty-eighth Annual Report, page* lvi.)

In some comments on the last Quarterly Return of Deaths in this district I endeavoured to show that the deterioration of health and the excessive mortality in Manchester were mainly due to the vitiation of its atmosphere. I showed that Manchester was amply supplied with good and pure water; that its artisans were in receipt of higher wages than agricultural labourers, and were better clothed and fed; that its streets were admirably paved, sewered, drained, and swept, so in this respect it may challenge comparison with any town in the kingdom. Other improvements on an extensive scale have been carried out, and its thoroughfares are now tolerably wide and spacious. Its hospitals, some of which are magnificent in structure and arrangements, as well as munificently supported, are dotted over the town; and the amount of its charities must be deemed honourable to its citizens. When to all this it is added, that the working men associate themselves in various benefit societies, under the names of Odd Fellows, Druids, Foresters, Gardeners, besides Packers and other trade societies, and that not less than from 20,000 to 30,000 of the adult males of the town are so associated, and receive assistance, pecuniary and medical, during sickness or when out of work, Manchester must be regarded in many respects as a model town; and yet it is one of the least healthy in the kingdom.

Children under five years of age contribute half of the total mortality, whilst in the agricultural districts one third of the deaths is their proportion. The artisan's wife dies in middle age; and his own career is cut short long before he has reached the seventy years' term allotted to man. In the Reports of the Registrar General through a succession of years, these facts have been fully established. Whilst the annual death-rate of England is 22 for a thousand of the population on an average of ten years, and that of favourably situated localities is very much less, falling in some to 15, it has been on an average of the same period for Manchester not less than 31, and for the year 1865 it amounted to 35·6.

The impurities of a town atmosphere may be distinguished into solid, vaporous perhaps vesicular, and gaseous; and the distinction is necessary, for whilst the solid impurities tend by their gravity to occupy the lower stratum of the atmosphere, and the vaporous or vesicular are subject only to the wafting of aërial currents, the gaseous tend by their own repulsive powers to general atmospheric diffusion. Their action on the human system is distinct. The solid impurities act as irritants to the respiratory organs; the vaporous or vesicular are the direct excitants of many types of disease; whilst the purely gaseous so depress and enervate the system as to render it an easier prey of disease.

Of solid impurities the principal one is coal smoke, which forms a continual dark and dense canopy over the town, and causes a murkiness in the streets from which they are never free. On the finest day the air is darkened by haze, through whose wide extent the prospect seems as it were bounded by an impenetrable wall. From a distance of four or five miles in the country, particularly on the approach of evening, the slanting rays of the sun give remarkable definition to the cloudy pall, and indicate very distinctly the site and limits of Manchester.

A rough analysis divides coal smoke into three parts. If the smoke is passed through a column of water in a suitable apparatus, a quantity of black fuliginous matter is separated from it, and some salts of ammonia are dissolved out of it by the water. If it be passed through a similar apparatus containing alcohol, a portion of bituminous matter is dissolved out, though this is still better accomplished by the substitution of highly rectified coal naphtha. There remains a quantity of purely gaseous matters, the composition of which is well known. The black matter separated by the water is found constantly floating in a smoky atmosphere in distinct particles, sometimes of considerable size, known popularly as "blacks." They settle in time on the streets and footpaths, find their way into the houses, cover all articles of furniture, soil and damage drapery, curtains, carpets, table covers, similarly affect wearing apparel and other surfaces, till it is generally recognized that light coloured clothes cannot be worn in Manchester, nor the hands remain clean if ungloved.

But these black particles always in the atmosphere are of necessity constantly inhaled by the inhabitants, constantly received into the lungs, whether those lungs are healthy or not. The best analysis of them with which I am acquainted is that of Braconnot (Annal de Chim. et de Phys. tom. 33), who found as the constituents :—

Carbon	79·1
Water	8·0
Resin	5·3
Bitumen	1·7
Sulphate of ammonia	3·3
Sulphate of lime	·8
Quartzy sand	·6
Ulmin	·5
Sulphate of potash	·4
	99·7

That a considerable portion of this soot is arrested in the upper air-passages there can be no doubt; but that a quantity also finds its way into the lungs, that is into the smaller ramifications of the bronchial tubes, and perhaps into the air cells, is proved by the black expectoration common among the residents of smoky towns, and by the carbonaceous matter found not only in the bronchial glands but occasionally also in the substance of the lungs when previous lesion has existed. It is possible indeed that in many cases the foreign body introduced into the lungs has caused the lesion. "It is necessary to be aware," says Dr. C. J. B. Williams (on Diseases of the Chest), "of confounding with "melanosis the accumulations of black pulmonary matter which take place to a great "extent in the lungs of old people, especially amongst the inhabitants of large towns. "These are probably, as Dr. Pearson observes, derived from the soot inhaled with the "air, which may find access to the texture of the lungs from such lesions of the bronchial "membrane as often result from a common cold or cough. Some curious cases are on "record in which carbonaceous accumulations have taken place so rapidly and extensively "as to cause chronic inflammation and consolidation of a perfectly black colour, which "tends to ulceration and the formation of cavities, as in other cases of chronic consoli-"dation." Drs. Gregory, Thompson, and others describe such cases as occurring in persons labouring under bronchial disease, whilst continually employed by the light of smoky lamps.

There can be no doubt that the constant inhalation of particles constituted as Braconnot has shown these to be, compounds mainly of carbon, bitumen, and sulphate of ammonia, must be highly irritating to the lungs, and productive in many instances of an amount of inflammation sufficient to induce incipient phthisis or bronchitis, or to determine the recurrence of these where a predisposition exists.

It is no answer to say that many people living in large smoky towns continue healthy, and attain to a considerable age. There are strong healthy people, with great powers of resistance, who form exceptions in all circumstances; but the general condition of old people, and of those approaching old age, in the working classes of Manchester, is bronchitic in a greater or less degree; and at all ages men, women, and children of delicate organization or scrofulous diathesis, or whose state of health has been reduced by other causes, are very much disposed to take on phthisical or bronchitic disease, under the irritating effects of a Manchester atmosphere. "Among the local causes of consumption," again to quote Dr. Williams, "is to be reckoned the habitual inhalation of fine solid "particles which is contingent on certain occupations. The dependence of the lesions in "these cases on the mechanical irritation of the inhaled particles is sufficiently proved "by the presence of these particles in the indurated lung, which in the case of colliers is "completely blackened with them." From a long and somewhat extensive experience I can fully confirm these observations. In estimating the effects of coal smoke in the production or excitement of phthisis, it is a question whether this disease should be regarded as the result of a low type or degree of inflammation. The essential condition of incipient phthisis is the formation of tubercle, miliary or diffused. Andral supposes the miliary and diffused indurations to be the result of chronic inflammation affecting the vesicles of the lungs or the general texture; and in this he is supported by Chomel and Louis. Dr. Williams, after showing that tubercular induration contains a greatly increased quantity of matter, and that it is not the result of diminished absorption, asserts it to be the result of increased secretion, implying an increased determination of blood to the part, and he inquires if this may not amount to inflammation. In acute pleurisy we have a secretion of coagulable lymph, soon becoming organised into a soft cellular membrane; but in a more chronic form of inflammation, a texture of lower vitality is produced, a kind of fibrous or cartilaginous structure. In acute pneumonia we have an effusion of lymph causing red granular hepatization; but in lower prolonged inflammation of pulmonary tissue we have a dark consolidation differing little from phthisical induration; whilst in long continued irritation, unattended by the more sthenic degree of vascular action, the texture is grey, dense, and semi-transparent, indeed exactly like miliary tubercle.

It may be shown that the mean annual mortality from diseases of the respiratory organs is greater in Lancashire and Cheshire than in other divisions of England, with the exception of London.

DEATHS of MALES to a hundred Males living (1851–60).

	From DISEASES of Lungs (exclusive of Phthisis).	From Phthisis.
Lancashire and Cheshire	0·417	0·299
Metropolis	0·448	0·329
Yorkshire	0·321	0·247
Durham, Northumberland, Cumberland, and Westmorland	0·263	0·221
Leicestershire, Rutlandshire, Lincolnshire, Nottinghamshire, and Derbyshire	0·264	0·214
Gloucestershire, Herefordshire, Shropshire, Staffordshire, Worcestershire, and Warwickshire	0·373	0·223
Middlesex (part of), Hertfordshire, Bucks, Oxfordshire, Northamptonshire, Huntingdonshire, Bedfordshire, and Cambridgeshire	0·273	0·220
Monmouthshire and Wales	0·253	0·298
Essex, Suffolk, and Norfolk	0·269	0·236
Surrey (part of), Kent (part of), Sussex, Hampshire, and Berkshire	0·269	0·247
Wiltshire, Dorsetshire, Devonshire, Cornwall, and Somersetshire	0·297	0·232

The above Table shows a higher mortality in London from this class of diseases than in other divisions; but even in London the mortality of females from phthisis is considerably less than it is in Lancashire and Cheshire, the rates being 0·249 and 0·334 respectively. But the contrast is more striking if the district of Manchester is compared with another, say Scarborough, where the total mortality is near that of England.

Scarborough.—Deaths of males from diseases of lungs (ex. phth.), 0·287 per cent.; from phthisis, 0·145 per cent.

Manchester.—Deaths of males from diseases of lungs (ex. phth.), 0·578 per cent.; from phthisis, 0·384 per cent.

Also the results for Manchester are less favourable than those for London.

Besides the palpable and offensive black particles of which the clouds that issue from our factory chimneys are composed, there is a more finely precipitated matter which in the country curls among the trees from the roof of a cottage, and in Manchester forms the constant haze of our streets. I do not think any scientific investigation has yet been made of it. It is not gaseous, for it does not diffuse; it is not simply vaporous. When it saturates or charges a November fog it is sticky, and excessively irritating to the eyes and throat. It proceeds from the imperfect combustion of bituminous matter, and partially from the distillation of the least volatile products of coal. Since it is so irritating to the eyes and lungs when made more dense by a fog, it must in a less degree be a constant source of irritation under the ordinary conditions of a smoky atmosphere. From experiments I have made on it, I am satisfied that it is in some degree bituminous.

From the way in which coal is ordinarily burned in the furnaces of manufactories, there are given off, in addition to the visible smoke, a number of invisible true gases, some of them resulting from the imperfect combustion of the coal; these are carbonic oxide, light carburetted hydrogen, sulphuretted hydrogen, and possibly a little cyanogen, and heavier carburets of hydrogen. The gases necessarily evolved are carbonic acid and sulphurous acid, with aqueous vapour. The natural tendency of all these gases is to diffuse themselves into the general body of the atmosphere; but the diffusion is, as regards some of them, to a considerable degree impeded by their extreme solubility, and by the quantity of moisture generally present in the atmosphere of Manchester. The carbonic oxide and light carburetted hydrogen have so little solubility that their diffusion would scarcely be diminished, and probably they may, with any small quantity of cyanogen or heavy hydrocarbons, be put out of consideration. Sulphuretted hydrogen, however, is at the least soluble in its own volume of water at ordinary temperatures. According to Thomson, one volume of water absorbs three volumes of the gas at 52° Fahrenheit, whilst of sulphurous acid gas thirty-three volumes are absorbed by one volume of water at ordinary temperature, according to the same authority. Carbonic acid is absorbed at the ordinary temperature by about its own volume of water. It is certain then that the presence of much moisture in the atmosphere, and even the vapour carried up the chimneys from the combustion of the coal, must materially interfere with the diffusion of these gases, and that a smoky town atmosphere must contain an abnormal amount of carbonic acid, and a distinct amount of sulphuretted hydrogen and of sulphurous acid. By a series of very careful experiments, Dr. Angus Smith has proved the existence of an excess of carbonic acid in the air of crowded rooms, and in the atmosphere of dense cities, and is disposed to attribute a considerable amount of injurious influence to this excess. That the air of Manchester contains sulphuretted hydrogen in considerable abundance is made evident by the rapid tarnishing of silver plate, and by the darkening of white paint. Now this gas is the most deleterious of them all. It is a direct and powerful poison, destroying life in a few minutes when in a concentrated state, and gradually lowering the vital powers, and reducing the tone of the system, when inhaled in a diluted form; and I know of no circumstance more likely to predispose a population for the reception of fever or cholera than the constant inhalation of an atmosphere vitiated by the presence of sulphuretted hydrogen. I do not believe there is sufficient ammonia in the atmosphere to take up all the sulphurous acid evolved from our chimneys, and the excess must act slightly as an irritant to the lungs. Sulphurous acid, however, except when very concentrated, seems to be breathed with impunity. It has no directly poisonous properties. It is assumed that sulphurous acid and sulphuretted hydrogen could not co-exist in the atmosphere, as they decompose each other; but whether this would be the case in the very dilute state in which they exist in the atmosphere has not been very accurately determined. At all events sulphuretted hydrogen does exist in the atmosphere of Manchester; and to it I should be disposed to attribute much more serious injury to health than to any of the other gases.

From the chimney of a perfect furnace nothing ought to be evolved but invisible carbonic acid, sulphurous acid, and watery vapour. All else, besides the ordinary atmospheric gases, oxygen and nitrogen, are the results of imperfect combustion. All smoke is the result of *distillation* with partial combustion of the product; and distillation of coal in an ordinary furnace means waste of the coal, and injury to the health of the people from poisonous sulphuretted hydrogen and irritant smoke, the consequences of that waste.

Even the sulphurous acid from coal might be considerably diminished by the careful washing out of the iron pyrites, as is already done to a large extent for some purposes; and when it is considered that these pyrites generally or always contain arsenic, which must pass into the atmosphere on combustion of the coal, the advantage of removing the pyrites as much as possible is most important.

In treating the smoke question it has been too much overlooked that in ordinary furnaces coal is subjected to a process partly of combustion and partly of distillation. Were sufficient heat applied, and a sufficient quantity of air of high temperature supplied

at the proper parts of the furnace, combustion would be complete, and no other products than carbonic acid, sulphurous acid, aqueous vapour, and a few salts of ammonia would be possible. There would be no visible smoke. But when coal is burned with air of limited amount or low temperature, then it is partly in the condition of that substance when in a gas retort. It is subjected to partial distillation. In an ordinary furnace this must ever be so. The coal instantly it is placed on the incadescent coke or cinders previously in the furnace begins to distil, and to give off gases and tarry matters. These meeting a certain quantity of hot air are partly decomposed; the hydrogen of the carburetted compounds is first burned and liberates free carbon, which is carried mechanically with other matters and undecomposed gases by the draught into the chimney. When the supply of air of high temperature is not sufficient to do more than this, the matters carried into the chimney will necessarily be such as would be given off by coal in a gas retort mixed with the unburnt carbon, &c., from such portions of the gases and tar as have been acted upon and decomposed by the air supplied. Now one of the most constant products of the distillation of coal in retorts is sulphuretted hydrogen. It is also a very abundant product; and it is quite clear that with a limited supply of air this gas must be formed in common furnaces, and that a portion must escape combustion, and be found in the atmosphere of smoky towns.

Mr. Wye Williams had a very clear conception of the cause of smoke, and proposed to meet the undecomposed gases and the liberated carbon at the back of the furnace by a fresh supply of air, believing that the gases could be sufficiently heated to enable the cold air to effect the combustion; and that the heat of combustion, or in other words the latent heat liberated by the gases on combustion, would be sufficient to maintain a proper heat under the boiler or other apparatus to be heated. This opinion was not justified in practice. It was found that cold air so applied was not sufficient to effect the entire combustion of the distilled matters, and that the latent heat did not compensate for the reduction of temperature caused by the cold air admitted. The experiment was a step in the right direction, but it was seen that for the economical consumption of the distilled gases air must be supplied which had already acquired considerable elevation of temperature before it came in contact with the gases. Many plans have been tried, but none so successfully as that of the Messrs. Siemens, in whose furnace air at a very exalted temperature meets and mixes with the gases at a like heat, in a special chamber. It differs from most others in being a process almost entirely of distillation; and it is a question whether, seeing the impossibility of combustion of large quantities of coal without partial distillation, some such process must not ultimately be adopted. But, while the principle is maintained, it may be necessary to modify the application of it, to meet special requirements. (*For continuation see page* xlv.)

Second Quarter.—April, May, June.

The United Kingdom.—The Registers of the United Kingdom show that 121,282 persons married in the quarter that ended 30th June; and that the births of 261,044 children, and the deaths of 171,869 persons of both sexes, were registered in the three months.

The corrected death-rate of the United Kingdom—2·385 per cent.—is slightly below that which prevailed in England and Wales. The several facts concerning the other divisions of the Kingdom are fully set forth in the quarterly reports of the Registrars General of Scotland and Ireland.

England.—The marriage-rate of the spring quarter was higher than it ever was before in that season since registration began. The birth-rate was also very high, and though it declined afterwards, it was still a little above the average in the three months that ended on June 30th. But a decidedly unfavourable feature of the present Return is the high death-rate that prevailed. The mortality was much higher than it had been in any June quarter of the ten years 1856–65. The coldness of the season, and epidemics of measles and whooping-cough, appear to have exercised a very wide and fatal influence on the public health.

Marriages.—In the quarter that ended 30th June 97,154 persons were married in England. The marriages were 48,577 against 45,827 in the same quarter of the previous year. They were more numerous by 10,000 than in the corresponding period of 1856. A marked increase in the marriages of last spring over the numbers of 1864–5 occurs in London, the South-Eastern Counties, Lancashire, the West Riding of Yorkshire, Durham, and Northumberland, and generally in the Midland Counties. The

marriages in London were 8764, in Liverpool and West Derby 1795, in Manchester 1250.

The annual marriage-rate in the quarter was 1·840 per cent. against an average of 1·70, or out of 1000 persons living rather more than 18 would have entered wedlock (while previously, taking one spring quarter with another, the number had been 17,) if the same rate that prevailed in the quarter had been maintained for a year.

Births.—The number of children born in the spring quarter (ended 30th June) was 192,427 against 173,263 in the same period of 1856. The annual birth-rate of the quarter was 3·644 per cent. of the population, the average of ten previous springs being 3·620.

The births returned in thirteen weeks ending 30th June numbered 26,776 in London, 1429 in the city of Bristol, 3236 in the borough of Birmingham, 4802 in that of Liverpool, 2591 in that of Leeds, 3353 in the city of Manchester. There were 4893 in Glasgow, a number which slightly exceeds that of Liverpool, though the population of the latter town is greater.

Taking twelve large towns in Great Britain it appears that the birth-rate was highest in Leeds, in which town it was 4·557 per cent.; the next highest was 4·543 in Glasgow; in Newcastle-on-Tyne it was 4·205; in Sheffield 4·009; in Liverpool 3·979. In London and Bristol it was as low as 3·50. But the population of Leeds, there is reason to believe, has been under estimated.

Increase of Population.—Whilst the births were 192,427, the deaths were 128,550. The natural increase of population was, therefore, 63,877. The movements of the population modify this result.

The total number of emigrants from ports in the United Kingdom, in the three months ended 30th June, was 80,303, of whom about 19,000 were of English origin; while the Scotch were nearly 5000, and the Irish 45,000. About 65,000 were destined to the United States, a number which exceeds the emigration to the same part in any June quarter in the last twelve years, with the exception of 1864.

Prices, Pauperism, and the Weather.—The price of wheat continues to rise; it was 46*s.* 6*d.* per quarter in the three months ending 30th June. Omitting the odd pence, the average prices of the six quarters subsequent to 1st January 1865 have been successively 38*s.*, 40*s.*, 43*s.*, 44*s.*, 45*s.*, and 46*s.* The mean of the highest and lowest prices of beef at Leadenhall and Newgate Markets was $5\frac{7}{8}d.$ per lb. last spring quarter. In the same period of 1864 it was $5\frac{1}{4}d.$; and in that of 1865, $5\frac{3}{4}d.$ The mean price of mutton was 7*d.* against $6\frac{1}{8}d.$ and $7\frac{3}{8}d.$ in the spring quarter of the two previous years. Best potatoes at the Waterside Market, Southwark, were 77*s.* 6*d.* per ton. The average number of paupers in the quarter were: relieved in-door 125,044; relieved out-door 734,748. In-door paupers were nearly equal as regards number to those of corresponding periods in the last two years. Out-door relief exhibits a decrease.

Mr. Glaisher writes:—"At the beginning of the quarter the weather was cold, the temperature being below the average to the mean amount of 2°·4 during the first nine days. The nights were also very cold, the thermometer frequently registering below freezing point, and rain fell copiously throughout the first two weeks. On the 10th of April a sudden change to heat set in, continuing till the 28th day, during which time the weather was unusually fine, and very hot for the season, and but little rain descended. This sudden drying weather caused large tracts of land in all parts of the country to be in such a heavy state that spring operations, particularly sowing, were much impeded, and in fact agricultural operations generally were in a backward state. The budding of trees was in general late, but at places where they had not already shot forth their leaves, the effect of this weather was extraordinary, the leaves appearing

g so suddenly, that the whole aspect was changed
he 29th of April a cold ungenial period set in,
to the 1st of June, with only an occasional day
aracter. The mean daily deficiency of tempera-
mounted to 3°·1, and at night the thermometer
32°."

weather again changed, and became much warmer,
cess over the average temperature occurred to the
the 11th day. A cold period followed, but on the
21st
erature again increased considerably, and fine weather
followed
end of the quarter, the mean daily excess of temperature
amounting t
early 5°."

The mean temperature of the air in the quarter was 53°, which is near the average. The rainfall was 7·9 inches, which is also near the average at Greenwich ; at Carlisle it was 3·6, Truro 9·7 inches.

Deaths ; and the State of the Public Health.—The deaths in the quarter that ended on June 30th exceed the average of the season. Their number is 128,550, and the mortality, after taking increase of population into account, exceeds the customary rate ; for instead of 22 the mortality was at the rate of more than 24 in 1000. The spring quarter is usually not only healthier than the quarter of winter or autumn, but healthier than the whole round of the year: but 24 is 2 in excess of the average of the last ten years.

The country districts, containing about 9,279,270 people, died at the rate of 22 in 1000 in the last spring quarter ; a rate exceeding the average (20) of those districts by 2. The town districts, of about 11,903,049 inhabitants, suffered still more, for in them the rate was over 26 in 1000, whereas their average is 23. The increase of the town rate is not only greater absolutely, but greater relatively than the increase of the mortality of the country rate.

Taking the thirteen great cities, as they may be called with regard to their magnitude and standing in the United Kingdom, the mortality, we find, was at the rate of 28 in 1000 ; in Birmingham, Hull, London, and Bristol 25, in Dublin 26, in Edinburgh 27, Newcastle-on-Tyne 29, Manchester and Salford 30, Sheffield 31, Glasgow 33, Leeds 34, Liverpool 38. In Liverpool the deaths nearly equal the births in number.

When we find that, exposed to nearly the same temperature and not very dissimilar atmospheric conditions, the mortality of the healthy districts, which have been so often cited in the reports, was 20, it is difficult to come to any other conclusion than that there is still something radically wrong in the sanitary administration of the towns of the kingdom. The root of the evil has not been reached. Vast numbers of the population, increasing every year, are blighted by causes which science has discovered, and which hygienic regulations might control. Condensation has an extraordinary tendency to impair the health of the people, and should be met by extraordinary measures.

London is one of the eleven great divisions of the kingdom, and has suffered to about the average extent. The mortality, which was 23 in the previous spring quarter, rose to 25. Not only small-pox, measles, and whooping-cough, but bronchitis and pneumonia grew more fatal. It is to be regretted that the Vaccination Act, which was originally ill-conceived, works badly. The measure requires amendment ; and the useless, impracticable registration clauses should be struck out. The deaths in London from diarrhœa were 289, from cholera 24 ; and a few of the cases of cholera were of an epidemic type ; but the deaths both from cholera and diarrhœa were much below the average. In the corresponding quarter of the previous year 706 deaths from diarrhœa, 32 from cholera, were registered.

The South Eastern Division comprising Kent, Surrey, Sussex, Hants,
s, experienced only a slight increase of mortality. The rate of

the spring quarter was 20; in the previous spring
whooping-cough were fatal at Kingston in Surrey
The deaths in the latter district were 118 against
quarter of the previous year. At Alverstoke
3 cases, of choleraic diarrhœa or infantile cholera
has been very fatal in Southampton, where the
were 262.

The mortality in the SOUTH MIDLAND COUNTIES w
that is one above the spring rate of 1865. Measles a
were epidemic in some districts.

The EASTERN COUNTIES suffered from the same epid and the mortality was at the rate of 22. One death from summer cholera was noticed at Cromer, and one from typhus.

The SOUTH WESTERN COUNTIES, usually among the healthiest, were also visited by measles and whooping-cough; the mortality was at the rate of 22, one higher than the previous spring rate. Small-pox prevailed fatally, and showed how much vaccination had been neglected by the people of Plymouth.

In proceeding to the WEST MIDLAND COUNTIES we enter a région where the mortality rose to 24, no less than 4 above the previous spring rate. Measles and whooping-cough prevailed extensively; the registrars notice one death from cholera in Madeley, 2 in Wolverhampton, one in Sedgley (Dudley).

In the NORTH MIDLAND COUNTIES the mortality at the rate of 23 was also above the average, owing apparently to the same causes. At Mansfield (Nottinghamshire) the deaths have been much above the average. The whole sewage of the town is poured into a rivulet, from which the water is diverted to work a water-wheel. Scarlatina was fatal in Bakewell, and 2 deaths from cholera are noted at Long Sutton (Holbeach).

The NORTH WESTERN DIVISION, comprising Cheshire and Lancashire, sustains its unhappy pre-eminence; the mortality was at the rate of 29, against 25 in the previous spring quarter. Typhus, scarlatina, measles, whooping-cough, and diarrhœa were fatal in several towns, at the head of which Liverpool stands. Ten deaths of Germans from epidemic cholera occurred in the emigrant depôt at Birkenhead. The Registrar of Preston conceives that the resumption of work in the cotton mills, and greater "indulgence in the use of intoxicating liquors," have contributed to the increase of deaths.

Yorkshire has grown more prosperous but less healthy than it was; the mortality was as high as 28. Leeds has suffered severely from fever. One death from cholera is noted at Pudsey (Bradford); 2 deaths of a mother and child were registered at Goole. They were attacked on the voyage from Antwerp. The steamers from Holland and Belgium should be under strict hygienic control; they have no doubt often been the channel for conveying epidemic disease to England. Passengers and cattle were at one time strangely huddled on these vessels.

The mortality in the northern counties was at the rate of 24; or one over the previous spring rate. Measles and whooping-cough killed 40 children in Berwick; they have thus reigned epidemically from south to north.

Wales has not escaped; the mortality was 24; somewhat less than it was last year. Newport and Swansea demand especial care. 49 fatal cases of fever are noted in Newport: 26 of whooping-cough in Lower Merthyr Tydfil. 11 deaths from cholera are recorded at Llangafelach in the Swansea Union. In Gower, near Swansea, 4 cases of "English cholera" occurred in one family; 3 were fatal. The Registrar did not attend them professionally, and he makes the following singular remark: "in fact being "poor people they received no medical attention!" Is there no Board of Guardians, no medical officer, in this deplorable district, where ne family three people "being poor" received no medical attention?

ITIATION of the ATMOSPHERE of MANCHESTER, WNS, by JOHN LEIGH, Esq., M.R.C.S., Registrar of Deansgate, Manchester. (*Continued from*

e Registrar General had the kindness to insert in his last d that the unhealthiness of Manchester and many other large the vitiation of the atmosphere by matters which might be , solid, vaporous (perhaps vesicular or even cellular), and n Manchester and similar manufacturing towns the chief solid smoke, and that its mode of action on the human body is of itant to the lungs producing bronchitis or assisting in the pro- of this disease, as well as of some diseases of the substance of evious lesion existed, and (2) by its sulphuretted hydrogen reducing tone and rendering it easily susceptible of zymotic diseases.

Besides co ke there are in such an atmosphere as that of Manchester various olid impurities to which persons who live in the country are less exposed. The houses stand close to the roads or streets, form in fact their boundaries, and from these streets, especially when macadamized, a fine impalpable dust is continually thrown up by the great and incessant traffic of drays and carriages of all kinds, grinding down the material of the oad, and loading the air with fine particles, which, when collected on a glass and viewed hrough a microscope, are seen to consist of sharp and angular fragments. The houses, rom their position, are scarcely less free from these particles than the streets; and to he residents they must be a constant source of bronchial irritation. The dust of manufactories must be chiefly confined within their walls, though a certain quantity will also find its way into the streets. It is well known that persons who work in flour mills for any length of time acquire a condition of lungs, from inhalation of flour dust, which gives rise to what is called "miller's asthma," a disease distressing, permanent, and ultimately fatal. Still more rapidly productive of a similar condition, and far more speedily fatal, is inhalation of metallic particles, as in the case of fork-grinders and others engaged in upations where metallic dust pervades the atmosphere. In the cleaning of cotton or woollen rags, a vast amount of dust is given off, and unless carried off by suitable trivances, as much injury must be produced by it on the lungs of workpeople as by ployment in a flour-mill. In fustian-cutting rooms there is a constant fine filamentous st, which must more or less be present in most departments of the cotton manufacture. st, of whatever kind, if long continued is injurious to the lungs, and though it is evitable in many manufactures, and the ordinary condition of streets and houses in arge towns must be more or less dusty, yet all practicable means should be adopted to emedy the nuisance in rooms or workshops, and to keep the streets as free as possible om it. In this respect both the asphalted and the ordinary stone or boulder paved ets are far superior to the macadamized.

The vaporous impurities of the atmosphere arise either from decomposing dead organic tters, are results in fact of the processes of putrefaction or fermentation, or they ceed from changes taking place in living animal bodies. They exist either more or dissolved in the ordinary atmospheric moisture, or in the moisture evaporated with m, or in a distinctly corpuscular form, perhaps vesicular or cellular. They are not ply gaseous, for they do not obey the laws of gaseous diffusion, and they do not dense into a solid form under circumstances in which condensation would be obvious. y are, I believe, vaporous or vesicular, and subject only to atmospheric currents. will saturate or remain suspended in the stagnant atmosphere of a chamber or Some of these, proceeding from living animal bodies, will attach themselves to ng, and will be carried from place to place. They will pass with the breath from a animal, or escape with the perspiration from the skin; they are capable of solution different menstrua, or perhaps of suspension only, and may be made evident by concentrated sulphuric acid and by permanganate of potass. They are able, under favourable circumstances, to reproduce themselves from other organisms, and to excite diseased actions, the same as those from which they themselves originated. They are of many kinds; distinct from each other; unlike in composition, organization, and action. The poisonous emanations of small-pox will not excite scarlatina, nor those of the latter whooping-cough, nor those of whooping cough measles. The emanations of measles will not produce typhus, nor those of the latter cholera. Each kind has its peculiar properties and functions, and produces its particular effect, as distinctly as does nitric, sulphuric, or carbonic acid. The physiologist in this department of physics is in advance of the chemist. The chemist, by passing air charged with any of these matters through strong sulphuric acid, or through a solution of permanganate of potass, obtains a colouring of his test, and announces the presence of organic matter; but the physiologist says: "True, there is organic matter; but there is one poison of cholera, another of typhus, "and a third of small-pox; and each of its own kind;" and organic chemistry should make a step forward, and definitively pronounce what they are. They are matters prone to change, able to set up actions in some organic or organized bodies that will produce others similar to themselves. An infinitesimal globule of small-pox matter received into the living body will cover it with pustules, filled with the like matter, and having the

same powers; or the smallest quantity passing out with [illegible] inhaled by another, will excite the same actions and pro[illegible] action of these poisons is nearer to fermentation or putre[illegible] processes with which we are acquainted. They are ma[illegible] complex composition, ready to be acted upon by any energ[illegible] to be converted into simpler organisms; and the simpler th[illegible] do they become. The oxygen of the atmosphere is their s[illegible] rupts, breaks them up, and never leaves them till it has convert[illegible] water, and ammonia, or its nitrate. Like all complex organized [illegible] nitrogen, and void of vitality, they are exceedingly liable to dist[illegible] and by oxidation they are rendered harmless.

But not only do certain diseased animal bodies give off into[illegible] powerful, and most active poisons,—living bodies, also in a state o[illegible] which, when concentrated or long retained in a confined portion of [illegible] ease, [illegible] ingly offensive; and if they do not actually produce any specific [illegible] or the actio[illegible] have a deteriorating effect on the general health, and give increased fa[illegible] of those more powerful emanations which produce specific disease. It is a matter o[illegible] common observation that they lower the tone of the system. There is perhaps nothing by which the sense of smell can be assailed more nauseating to those unaccustomed to it than the odour of a close chamber, in which a large number of unclean persons have slept or have been long confined. This offensive smell may arise either from the concentration of evolved matters, or from changed condition, the result of partial oxidation o[illegible] putrefaction, just as sulphur in many organic compounds will remain insensible till decomposition commences, when it becomes offensively evident as sulphuretted hydrogen or other sulphur compound.

The following are the names of the 139 Districts and 56 Sub-districts comprising the CHIEF TOWNS:—All the 37 Distric[illegible] Croydon, Kingston, Richmond, Gravesend, Medway, Tunbridge; *West and East Maidstone Sub-districts* (Maidstone); *Minster Sub-district* (Sheppey); Thanet, Dover, Hastings, Brighton; *Shoreham Sub-district* (Steyning); Portsea Isla[illegible] Southampton; *Winchester Sub-district* (Winchester); Reading, Brentford, Edmonton; *St. Clement Sub-district* [illegible] Oxford, Northampton; *Peterborough Sub-district* (Peterborough); *Bedford and Kempston, and Bedford and Cardingt[illegible]* (Bedford); *Luton Sub-district* (Luton); Cambridge, West Ham, Colchester, Bury St. Edmunds, Ipswich, Yarmou[illegible] K[illegible]g's Lynn, Melksham, Salisbury; *Weymouth Sub-district* (Weymouth); Exeter; *Torquay Sub-district* (Newton A[illegible] mou[illegible]h, East Stonehouse, Stoke Damerel, Truro, Redruth; *St. Mary Magdalen and St. James Sub-districts* (Taunton); *Sub-a[illegible]trict* (Bridgwater); Bath; *Bedminster Sub-district* (Bedminster); Bristol, Clifton; *St. Nicholas and St. John Bap[illegible] districts* (Gloucester); Cheltenham; *Hereford City Sub-district* (Hereford); Madeley, Shrewsbury; *Stafford Sub-district* (Stafford) *Newcastle-under-Lyme Sub-district* (Newcastle-under-Lyme); Wolstanton, Stoke-upon-Trent; *Burton-on-Trent Sub-distri[illegible]* (Burton-on-Trent); Wolverhampton, Walsall, West Bromwich, Dudley, Stourbridge; *Kidderminster and Lower Mitton Sub-distric[illegible]* (Kidderminster); Worcester, Birmingham, Aston, Coventry, Warwick; *Loughborough Sub-district* (Loughborough); Leicester *Boston Sub-district* (Boston); *Lincoln Home Sub-district* (Lincoln); *Great Grimsby Sub-district* (Caistor); Radford, Nottingham *Newark Sub-district* (Newark); Derby, Hayfield, Stockport; *East and West Macclesfield and Sutton Sub-districts* (Macclesfield) *Runcorn Sub-district* (Runcorn); *Congleton Sub-district* (Congleton); *Chester Castle and Chester Cathedral Sub-districts* (Gre[illegible] Boughton); Birkenhead, Liverpool, West Derby, Prescot, Wigan, Warrington, Leigh, Bolton, Bury, Barton-upon-Irwel Chorlton, Salford, Manchester, Ashton, Oldham, Rochdale, Haslingden, Burnley, Blackburn; *Chorley Sub-district* (Chorley) Preston; *Lancaster Sub-district* (Lancaster); Keighley, Todmorden, Huddersfield, Halifax, Bradford, Kirkstall, Hunslet, Holbec[illegible] Bramley, Leeds, Dewsbury, Wakefield, Barnsley, Ecclesall Bierlow, Sheffield; *Doncaster Sub-district* (Doncaster); *Boothar Micklegate, and Walmgate Sub-districts* (York), Sculcoates, Hull; *Scarborough Sub-district* (Scarborough); *Darlington Sub-distri* (Darlington); Stockton, Hartlepool; *St. Oswald and St. Nicholas Sub-districts* (Durham); Houghton-le-Spring, Sunderland, Sout Shields, Gateshead, Newcastle-upon-Tyne, Tynemouth; *St. Cuthbert and St. Mary Sub-districts* (Carlisle); *Whitehaven Sub-distri* (Whitehaven); *Kendal Sub-district* (Kendal); *Newport Sub-district* (Newport); *Cardiff Sub-district* (Cardiff); Merthyr Tydfi *Llangafelach and Swansea Sub-districts* (Swansea); *Llanelly Sub-district* (Llanelly); *Pembroke Sub-district* (Pembroke).

Note.—The three months January, February, March, contain 90, in leap year 91 days; the three months April, May, June, days; each of the last two quarters of the year, 92 days. For this inequality a correction has been made in the calculations, also t the difference between 365 and 365·25 days, and 366 and 365·25 days in leap year.

In our ignorance as to how the poisons productive of zymotic diseases originated, it may not be unreasonable to ascribe them to the concentration, under special circumstances, of the ordinary emanations of the animal body, when the latter had been reduced in tone and strength by suffering and privation, or had been placed under conditions of excessive foulness. In the present day the poison of typhus seems frequently to be

developed where human beings are crowded in cellars or other places in which ventilation and cleanliness are neglected. The poison of cholera, so far as we know, is of comparatively modern origin. It had its birth in the warmer regions of Asia, amongst the miserable devotees who arrived travel-worn at the banks of the Ganges and Jumna. Whatever doubts may have existed hitherto as to the mode of its propagation must be nearly dissipated by observation of recent outbreaks on the shores of this country or in neighbouring waters. Brought in a crowded vessel by unclean immigrants, from a district already infected, it confined its ravages to them and their immediate attendants. During an invasion of cholera in Manchester I traced every case, and ascertained in every instance that there had been communication with infected persons, or infected localities; and have already published the results of these inquiries. I believe there is no instance of the spontaneous outbreak of true cholera in this country. It is a specific disease, altogether distinct from what is called "English cholera," which is attended by or results from an excessive secretion of bile during the autumn; whereas in true Asiatic cholera there is a suppression of the biliary secretion. Purging and generally vomiting are the most marked characteristics of English cholera, there is excessive discharge of biliary fluid; but in Asiatic cholera where vomiting and purging supervene, the discharges are colourless and free from bile; and in the most rapidly fatal cases that I have seen there was no purging or vomiting at all. The system was simply poisoned, and death took place in three or four hours from the first effects. The most rapid effects of the cholera poison remind me more of those of cyanogen compounds than of any other.

These various emanations from the human body, the poisonous emanations of smallpox, typhus, scarlatina, &c., and certain natural secretions from the skin and lungs,

mainly affect the atmosphere of confined spaces which the sick occupy, or in which many persons are assembled. Wafted into the external atmosphere they probably become so diluted, or suffer such chemical changes, as render them incapable of reproducing their original types. The more general vitiation of the atmosphere, by impurities which I have classed as vaporous, is due to matters given off during the decomposition of dead organic substances. These matters vary according as the substance is animal or vegetable, and accompanied by the presence of more or less moisture. It has been usual to treat of these matters as simply gaseous; but though true gases are given off at certain stages of the decomposition, as sulphuretted hydrogen, carburetted hydrogen, phosphoretted hydrogen, and some compounds of nitrogen, yet, undoubtedly, some matters are also evolved, either preceding or accompanying these, quite distinct from them, and probably of much more complicated organization, in fact in a less advanced stage of decomposition, matters intermediate between true gases, the ultimate results of complete decomposition, and the bodies from which they have been evolved. No chemist accustomed to the smell of true gases, or of any compounds or admixtures of these, would ever confound it with the peculiar and often most offensive smells attending the decomposition of dead organized bodies. The smell of a dead and putrid animal, of a dissecting room, of a tallow-melting work, of an animal size manufactory, of the Thames, of the Irwell, Medlock, and Irk rivers at Manchester, is totally unlike that of any known gas, or of any known combination of gases. The common tests, sulphuric acid and permanganate of potass, will indicate the presence of organic matter in an atmosphere infected by such smell, but will throw no further light on its nature. That the chemical composition of the substance causing the smell will vary with the character of the latter is probable, and, possibly, with its physiological effect on the human system; but we have at present so little

scientific knowledge relating to it, that even its physical condition is open to discussion. I have endeavoured, on what I believe to be good grounds, to show that it is not a true gas; but whether it be minutely cellular, or simply vaporous, I do not know. The study of the chemistry of the atmosphere beyond its oxygen, nitrogen, carbonic acid, and ammonia, is yet to be begun. We do not even know whether it contains ozone, as the phenomena attributed to the latter are otherwise explicable. The physiological effects of the east wind are often quite independent of its coldness. A north wind will often cause common colds or catarrhs; but the east wind, which is less cold, frequently produces distinct influenza. I was much struck with this last spring, which was very dry, and during which east winds were prevalent. On one occasion I was several miles from Manchester; quite in the country, and far away from the smoke; the atmosphere was unusually dry, the wind blew from the east, and there was a peculiar haziness in the air, like a fog, so that objects at a moderate distance could not be distinctly seen. In a few hours many people were complaining of influenza. Now this was no common fog; the air was very dry, and the wind not very cold, much less so than a north wind which succeeded it.

It is probable that every heap of decomposing organic matter, every foul ditch or collection of stagnant water, and every polluted stream, that crowded graveyards and manufactories of animal substances, transmit to the atmosphere matters injurious to the human system. The close and festering jungles and estuaries of rivers in tropical regions produce their characteristic fevers; undrained fens, ague and enlarged spleen; and the filth of close, thickly-peopled, and ill-ventilated localities breeds typhus; and even when such grave results are not experienced the general health suffers deterioration.

In country places in England the chief sources of these injurious emanations are the heaps of manure constantly found in close proximity to farmhouses, and to their owners the objects of fond contemplation and delight. So powerful a disinfectant is porous soil, in which, probably, oxygen exists considerably condensed, as it is known to be in charcoal and most porous bodies, that once mixed with it, or well covered by it, the fetid matters of the dungheap become rapidly oxidized, and converted into carbonic acid, water, ammonia, and probably alkaline nitrates. They are decomposed, and rendered harmless. This powerful action of the soil as an oxidizer and decomposer of effete matters should not be overlooked in any arrangements for the removal or utilization of sewage. Oxygen is also much more soluble in water than in nitrogen, so that rain and spring water contain a considerable quantity of the former in solution, ready to act with energy and rapidity on partially decomposed matters. By such benign arrangements a well-drained soil is always sweet and grateful. The perfect chemistry of nature finds a use for all effete matters; and in return for these she gives the tender herb, sweet scented flowers, and fruits.

In large towns we find the sources of atmospheric vitiation of the class under review in undrained and unsewered streets, courts, and houses, in cesspools, foul drains, and streams, graveyards, unsluiced sewers, and wherever animal and vegetable matters are undergoing spontaneous decomposition.

It is probable that no town in England has a sufficient supply of water for all sanitary purposes. The frequent sluicing of sewers is most important to the healthy condition of a town, and the street openings or grids should be closed during the operation. The occasional partial sluicing of sewers by rain, at long intervals, is of doubtful benefit to a town. The foul matters in the sewers become stirred up without being fully carried away; much sulphuretted hydrogen and other gases become liberated, besides decomposing

substances or vapours; a current of air opposed to that of the stream in the sewers is originated, and escapes at the grids or street-outlets; for the gas in the sewers is lighter than atmospheric air, and ascends to the street openings, instead of following the stream of liquid to the outlet of the sewer.

It may seem to be of little consequence whether we regard these emanations as purely gaseous, vaporous, or existing in some other subtle form. But the more accurate the conception we form of their physical conditions the more likely are we to arrive at their distinctive characters and properties. Some attempts have been made in this direction already. Dr. Calvert has made a chemical examination of the odorous matter infecting the atmosphere from an unhealthy ulcer, and has shown it to possess basic properties; and other investigators have endeavoured to establish a relation between certain cryptogamic sporules and marsh fever.

The question has also a practical bearing in relation to general sanitary arrangements; for whilst the true gases are obedient to a law of rapid diffusion, from mutually repulsive property of their particles, and pass into the general body of the surrounding air, the law being that the diffusive power varies inversely as the square root of the density of the gas itself, the gases retaining under all atmospheric temperatures and pressures their gaseous condition; yet vapours of highly complex constitution are generally of low tension, and speedily attain their condition of maximum density. It is probable that the vaporous matters exist in the condition of cloud, if clouds may be defined as "masses of "air which contain innumerable minute particles of suspended matter condensed from "a state of vapour." Whether this condition is intermediate between fully formed vapour and liquid, and is constituted of minute vesicles, as maintained by Saussure and other observers, is at the present time undetermined. There is a good deal to be said both for and against the theory; but in any case, whether vesicular or in a finely divided liquid form, or even approaching the solid form, it is evident that they are not, like true gases, capable of diffusion, but can be acted upon only by atmospheric *currents*;—they can be wafted and blown away, but *not diffused*. The practical bearing of this then is, that wherever a confined district is in a bad sanitary condition, where zymotic or infectious diseases prevail, where bad smells are evident, and there are indications that matters not properly belonging to a pure atmosphere are floating or suspended in it, after removal, as far as practicable, of the causes producing the emanations, effectual currents of air should be drawn through the courts, alleys, houses, &c. that are the seats of contamination.

Very difficult is the task in a large town where abominations have grown to a magnitude commensurate with the town itself. Private munificence, of which a splendid example has lately been given to the world, should be directed into this channel in every English town. Unfortunately, in many districts, the very habits of the people are fatal to all efforts at improvement. With water at their doors, their houses and persons are inconceivably dirty. With the windows constantly closed, particularly of their sleeping rooms, the atmosphere of their apartments is reeking and noisome to an extent incompatible with health; and it is in such districts that when an epidemic breaks out it finds its greatest number of victims. In cholera maps, shaded in the ratio of mortality, the blackest tints cover these localities. But pestilence, once established, is not confined to these places, it spreads to better districts, and involves rich and poor in like disaster. All ranks of persons are vitally interested in the sanitary condition of their towns or villages; and upon all it rests as a sacred duty to assist in promoting so great and noble an enterprise.

Third Quarter.—July, August, September.

The United Kingdom.—The Registers of the United Kingdom show that the births of 239,873 children, and the deaths of 150,855 persons of both sexes, were registered in the three months ending on September 30th.

The marriages of the United Kingdom in the quarter ending September 30th were 56,924.

The corrected death-rate of the United Kingdom—2·061 per cent.—is less than that prevailing in England and Wales. The several facts concerning the other divisions of the Kingdom are set forth in the reports of the Registrar General of Scotland and the Registrar General of Ireland.

England.—The marriage-rate of the summer quarter was above the average. The birth-rate of the quarter was near the average. The country was visited by cholera, and the mortality was raised much above the summer average by the epidemic in some districts, while the rest of the kingdom was unusually healthy.

Marriages.—There were married in the summer quarter (ended 30th September) 92,514 persons; against 89,350 and 91,704 in the two corresponding periods of 1864–65. Of marriages in London the number was 9038. Lancashire exhibited a marked increase, the marriages in the last three summer quarters in the seat of cotton manufacture having been successively 6534, 6628, and 7075. But while the marriage-rate prospered in the Manchester district, where the numbers in the three periods were 1105, 1200, and 1277, it declined in Liverpool as the returns show; in the two previous summers 1210 and 1112 couples married, and last summer only 1082.

If the marriage-rate in England that prevailed last summer were maintained for a year, the proportion, to the population, of persons who entered wedlock would be 1·726 per cent. against an average of 1·621. Seventeen marrying persons in a thousand of the population is a high annual rate for the first nine months; but it would be low if it occurred in the autumnal quarter, namely, the last three months of the year.

Births.—In the quarter ending 30th September 179,096 children were born. The number was about 2000 less than in either of the two previous summer quarters. The annual birth-rate for the quarter was 3·344 per cent., the average of 10 corresponding quarters (1856–65) being almost identical, namely, 3·343 per cent.

* Approximated to the results of Robinson's Anemometer by reductions from Whewell's up to 1859.

Increase of Population.—The deaths last quarter were 116,653, and if compared with the births there is a difference in favour of the latter of 62,443, which number represents the natural increase of population.

The total number of emigrants in the September quarter from ports in the United Kingdom where Emigration Officers are stationed was 47,153; they were as many as in the same period of 1864, but not so many as in that of 1863, and few as compared with emigrants who left in the summer of 1865. Taking round numbers, 36,000 (of whom half were natives of Ireland) out of the 47,000 went to the United States, nearly 7000 to the Australasian and nearly 4000 to the North American colonies.

Prices, Pauperism, and the Weather.—The price of wheat, which had been gradually rising from 38*s.* per quarter in the March quarter of 1865 to 46*s.* in the spring of the present year, suddenly rose last quarter to 51*s.* Beef was also dear last quarter, the mean price having been $6\frac{1}{8}d.$ per lb., as sold by the carcase at Leadenhall and Newgate Markets, against $5\frac{1}{2}d.$ and $5\frac{3}{4}d.$ in the corresponding period of 1864 and 1865. Mutton did not rise, the price having been $5\frac{1}{2}d.$ for inferior and $8\frac{1}{4}d.$ for superior quality; the mean price $6\frac{3}{4}d.$ Best potatoes at Southwark rose to 97*s.* 6*d.* per ton. Thus the tendency of provision markets was decidedly upward.

The quarterly average number of paupers relieved on the last day of each week was, in-door 120,985, out-door 717,555. The former number is rather high for the season, but the latter number shows a decrease, probably owing to the lateness of the harvest, by which labourers would be engaged longer than usual in field work.

The mean temperature of the air in the quarter at Greenwich was 58°·9, which is 1°·1 below the average of the season in twenty-five years. Each of the three months, but particularly August, was cold. The rain-fall measured 7·9 in., half of which was in September, when the amount was an inch and a half in excess of the average. Mr. Glaisher writes that the weather, which had been warm and fine at the close of the previous quarter, changed to cold at the beginning of July, and in every part of the country rain fell almost daily. From the 9th to the 17th was a period of heat, but from the 18th July to the 27th September the temperature was almost constantly low. Rain fell frequently all over the country in July; and in August seriously interrupted harvest work. In September the atmospheric pressure was always low, and in Guernsey and the west of England eight or nine inches of rain fell; near the east coast three inches; about London four inches. In the midland counties there were floods;

thousands of acres were under water, and much damage was done. In the three visitations of cholera in past years there was great atmospheric pressure, high temperature, narrow diurnal range owing chiefly to high night temperature, defect of rain, wind, and electricity; and in the last of those (1854) a remarkable blue mist was observed which prevailed night and day. In nearly all these particulars the meteorological character of the present epidemic season is different from that of previous periods when cholera prevailed; but the blue mist has been again visible; it was first seen by Mr. Glaisher on 30th July, and by other observers in the preceding week. Since that time it has been generally present; on some days no trace of it visible, and on other days seen for parts of a day only. It has extended from Aberdeen to the Isle of Wight, and was of the same tint of blue everywhere. This mist increased in intensity when viewed through a telescope; usually no mist can be seen when thus viewed; it increased in density during the fall of rain, though usually mist rises from rain. Its density did not decrease when the wind was blowing moderately strong; it decreased when a gale was blowing, but increased again on its subsidence. Whatever may be its nature, he adds, the fact is very remarkable, that since the cholera period of 1854 this phenomenon has not been observed till the present time.

Deaths; and the State of the Public Health.—116,653 deaths were registered in the 92 days ending September 30th; and the annual rate of mortality was 2·179 per cent. This exceeds the average mortality of the last ten summer quarters by ·177, or one twelfth part; and the excess on the population is equivalent to 9475 deaths. The deaths returned from cholera amounted to 10,365; the deaths from diarrhœa, also due in great part to the same cause, to 9570.

The mortality was at the rate of 25 per 1000 in the large town districts, and 18 in the village and small town districts; the excess in the large town districts was 7. The mortality in the town districts was considerably above its usual summer average; while in the rest of the country the increase was slight.

The three months of July, August, and September are now usually the healthiest of the year in England; and their average annual rate of mortality per 1000 is 20, but their mortality during these months in the present year was at the rate of 22.

The mortality of London was at the rate of 29 in 1000; of the North Western Division 27; in the two Northern Divisions and in Wales, the mortality was at the rate of 22. In the other divisions the mortality was low, and indeed lower than their average: in the South Eastern Division

XI. MONMOUTHSHIRE AND WALES	21·28	22·79	23·92	23·45	22·31	21·49

Note.—The above mortality for the *year* 1866 is the mean of the quarterly rates.

it was 18, in the South Midland it was 18, in the Eastern 18, the South Western 17, the West Midland 17, and in the North Midland Division 18.

Upon turning to the large cities of the United Kingdom, still greater divergences are observed ; the mortality was at the rate of 19 in Birmingham, 21 in Bristol, 22 in Hull, 24 in Sheffield, 26 in Salford, 31 in Manchester, 32 in Newcastle-upon-Tyne, 50 in Liverpool. In Edinburgh the rate of mortality was 23, in Glasgow 25, in Dublin 24. The excessively high rates of mortality are generally due to the invasion of cholera.

It is well known that this epidemic raged around us in France, Belgium, and Holland earlier in the year, and during July it established itself in England, where it put the sanitary defences of nearly every district on the coasts to the test. Indeed the cholera matter (*Cholrine*) has evidently been diffused all over the kingdom ; for in every county, except Herefordshire and Rutlandshire, deaths from cholera have been registered, and diarrhœa has prevailed to such an unusual extent as to imply the existence of some specific zymotic element. It was only, however, when that element was diffused by water, and by the wilful neglect of hygienic precautions, that the mortality became appalling.

Thus, although the waters are yet by no means free from impurities, the people of London are no longer supplied as they were in 1849 with unfiltered waters contaminated by their own sewers ; and the deaths in the districts of the West, North, Centre, and South of London were 1023 by cholera and 1558 by diarrhœa, among 2,430,046 people. Whereas 3691 deaths by cholera and 740 by diarrhœa, that is, 4,431 together, occurred in the East London districts, among 607,945 people supplied with water chiefly from the Old Ford reservoir of one company. Deduct these deaths, and the deaths by cholera in London are reduced to 1023, while the deaths by cholera in England are reduced from 10,365 to 6674. Again, of the 2022 deaths from cholera in Lancashire and Cheshire no less than 1603 were registered in the Liverpool and West Derby Districts alone. Deduct these deaths, with 2447 more in West Ham (adjoining East London, and supplied with the same water), in Portsea Island, in the Isle of Wight, Southampton, Exeter, with three adjacent districts of South Devon and Swansea, as well as in certain districts of South Wales, and the deaths from cholera in the rest of England are brought down to 2624.

This proves that although the freest intercourse has been kept up between the various parts of the country the epidemic has only assumed an aggravated form where the defences have been weak and circumstances have been in its favour.

By some fatality, Dr. Trench, the able medical officer of health for Liverpool, " ceased to have any direct voice in the cholera arrangements so " soon as the Orders in Council were issued." Energetic measures were, however, adopted by the vestry with his approval.

On the other side of the Mersey is Birkenhead, exposed to the same epidemic influences as Liverpool ; and in that district the deaths from cholera only amounted to 30 out of a population of more than 61,420.

Dr. Baylis, the Medical Health Officer, thus describes the successful precautions taken at Birkenhead :—

In addition to ordinary measures, we commenced a system, before its appearance, of deodorizing all the worst middens in the town, on the principle that, if we could destroy the gases of decomposition in the worst parts of the town, we should remove one of the greatest depressents of the vital force ; this system was carried out more effectually after the disease appeared.

I saw the first patient that died, and my friendly connexion with all the medical men of the place enabled me to reach nearly every succeeding fatal case. To the friends of each I gave the most urgent instructions, furnished the poor with disinfectants, sprinkled their floors with carbolic acid, had chloride of lime regularly thrown in their and neighbouring ashpits, used carbolic acid in their waterclosets and drains ; took, in the first instance, and until the guardians moved, the responsibility of burning the soiled bedding ; had all the soiled clothes steeped in chlorine water, and saw that the houses were perfectly cleansed down. Finally the body was partially covered with charcoal, and buried in a few hours.

By these means the disease, I think, was in most instances stamped out; and I feel sanguine, if there was a proper staff for the purpose, with the necessary power, together with the means of getting at every case attacked, a medical officer, accustomed to his duties, and otherwise competent, would have a good chance of keeping down the malady, where the conditions were not so very bad as to preclude all chance of success.

I confess, however, with every wish to do our duty, for want of more power, the careless, the drunken, and the stolid poor defeat one occasionally, and then we had, in some instances, a second and a third case in the same house. These, however, were the exceptions.

The mortality of Birkenhead on the south side of the Mersey, was at the rate of 24 in 1000, while the mortality in the borough of Liverpool on the north bank of the river was 50. The deaths in Liverpool at the Birkenhead rate would have been about 2906 ; the actual deaths were 6091.

The cholera has prevailed, as on former occasions, in particular fields. The London cholera field, by extension down the Thames, reached Ramsgate. The second considerable field lies round the Solent along the coast from Portsmouth and Southampton to Newport in the Isle of Wight. The Exeter field extended beyond Torbay to Totnes and Brixham. The Liverpool field extended to Chester, Wigan, and Bolton, but scarcely touched Manchester. The Swansea field was visited with extreme severity; and although the mortality was concentrated mainly on Swansea, Neath, and Llanelly, it was felt all over Glamorgan, Carmarthen, and Pembroke, as far as Haverfordwest.

The epidemic has been most fatal on the sea coast, in the chief ports of the kingdom. It is by no means capricious, but obeys definite laws. It never destroys the people to any extent where the water supply is pure, or where the hygienic conditions are good, when the authorities adopt judicious and well organized measures of early treatment and systematic disinfection.

Those districts which are supplied with bad water, have no effective system of sewage, have no Health Officer, and have no precautions in force, should immediately set their houses in order, as they are still in imminent danger.

Fourth Quarter.— October, November, December.

The United Kingdom.—The Registers of the United Kingdom show that the births of 247,112 children, and the deaths of 157,803 persons of both sexes, were registered in the three months ending on December 31st.

The marriages of the United Kingdom in the quarter ending December 31st were 68,771.

The corrected death-rate of the United Kingdom—2·164 per cent.—is less than that prevailing in England and Wales. The several facts concerning the other divisions of the Kingdom are set forth in the Reports of the Registrar General of Scotland and the Registrar General of Ireland.

England.—The birth-rate was unusually high, the death-rate below the average, the marriage-rate above the average. The aspect of these returns is favourable in every respect. Marriages have abounded, births have followed in unusual numbers, and deaths, in spite of an imminent epidemic, have been less frequent than in the corresponding seasons of former years. Hygienic measures have been prosecuted with unusual activity, and apparently with good results.

Marriages.—In the last three months of 1866 the number of persons married was 110,726. The marriages were 55,363, and were less by 1625 than in the corresponding period of the previous year. In London the number of marriages was 9103 against 9738 in the December quarter of 1865 ; in the West Midland counties 6386 against 6981 ; in Yorkshire 6129 against 6285 ; in the Northern counties 3013 against 3284. In the counties of the cotton manufacture the marriages maintained their activity better, the number there having been 8653 against 8583.

During the last three years the marriage-rate has been unusually and persistently high; and this statement holds equally good in respect to the last quarter of 1866, though in it the marriage rate (2·064) was not so high as in the same period of 1865, when it was 2·146, which proportion represents *persons married* to a hundred of the whole population. The average rate of the December quarter in the ten years 1857–66 is 1·99.

Births.—The number of children born last quarter (ended 31st December) was 185,594; it exceeded by 6000 the number of births in the autumn of 1865. To this increase nearly the whole kingdom appears to have made more or less contribution; but in Cornwall there was a very striking decrease of births, for the number fell in that county from 3051 to 2652, a fact hardly to be accounted for except by active emigration.

The annual birth-rate in the quarter was high; it was 3·458 per cent. against an average of 3·32.

In thirteen large towns in the United Kingdom the births in the last quarter were relatively to population most numerous in Leeds, where the birth-rate per annum was as high as 4·318 per cent. In Sheffield the rate was not much lower, having been 4·198; in Glasgow it was 4·024; it did not touch 4 per cent. in Hull, but was 3·963; in Liverpool it was 3·873; in Salford 3·854; in Birmingham 3·739; in Newcastle-on-Tyne 3·624; in London 3·571; in Manchester and Edinburgh it slightly exceeded 3·5, and in Bristol did not attain that point.

Increase of Population.—The deaths last quarter were 117,352; and as the births were 185,594, the balance was in favour of population, and the natural increase 71,242.

The emigration of the December quarter from ports in the United Kingdom, where emigration officers are stationed, comprised 32,909 persons; these being nearly as many as in the same period of 1864, but much fewer than in that of 1863 or 1865. Of that number about 11,351 were of English, 2676 of Scotch, 14,666 of Irish origin. Giving round numbers, 26,000 out of the 33,000 were destined to the United States, of whom 7000 were English, and 13,000 Irish. The main current of emigration being westward, Liverpool was the chosen port of embarkation to 21,000. Only 2954 persons left the Thames. From London and Liverpool, emigrants for Australia went in nearly equal numbers.

Prices, Pauperism, and the Weather.—The price of wheat has been constantly rising for two years; and in the last three months of 1866, when it was on an average 56*s.* 8*d.* per quarter, it was much higher than it had been since the September quarter of 1862. The average prices of beef by the carcase at Leadenhall and Newgate Markets were $4\frac{3}{4}$*d.* per lb. for inferior, and 7*d.* for superior qualities. They showed a slight tendency to decline from the high prices that had ruled in the summer. The prices of mutton fell; the lowest and highest averages were respectively $5\frac{1}{4}$*d.* and $7\frac{1}{2}$*d.*; they were lower than they had been previously since the early part of 1865. Potatoes were dear. The mean price of the best at the Waterside Market, Southwark, was 107*s.* 6*d.* per ton. Prices ranged from 85*s.* to 130*s.*, and were higher than they had been for three years.

The average number of in-door paupers relieved on the last day of each week was 134,086, a number which is more by five or six thousand than it had been in the corresponding period of either of the two previous years. Out-door paupers were 735,654 against 724,792 in the autumn of 1865.

The close of the September quarter was distinguished by much rain and the want of sunshine, and by south-west winds which had long prevailed. In the first week of October the barometer rose, the wind changed to north-east, and the mean temperature for eleven days was 3° above the average. This was followed by a week of cold weather. From 19th October to the end of the quarter the temperature was in excess without any considerable interruption, except from 28th November to 2d December, in which period the weather was cold.

October closed with variable weather, sometimes with fog, at others with rain, and occasionally white frosts at night. In the beginning of November barometric pressure exhibited great fluctuations; snow fell in Scotland; and throughout the month the weather was changeable. In December there was frequent rain, and there were very heavy gales from the south-west; but the month was unusually mild for the season. The last two months were favourable for agricultural operations. In November ploughing and sowing made great progress, except in Yorkshire and Lancashire, where about the middle of the month were extensive floods; and at the end of the year the pastures were of a fresh green, and food for cattle was abundant.

At Greenwich in each month the mean temperature was above the average. It was 51·3° in October, 44·3° in November, 42·9° in December; the mean of the quarter was 46·2°. Rain fell to the amount of 5·4 in. in the quarter, which is 1·7 in. below the average.

Deaths; and the State of the Public Health. — 117,352 deaths were registered in the 92 days ending on the last day of the old year, and the mortality was at the annual rate of 2·187. The mortality is thus lower than the average by ·018, and not higher than the mortality of the last summer quarter, when it was raised by cholera in East London, in Liverpool, and in some other towns.

The chief characteristic of the season is the diffusion of cholera over the remotest parts of the kingdom, and its restricted ravages everywhere except where the people are living in the open violation of the laws of health. In London 834 deaths by cholera were returned, and in the districts around a small number: in Godstone 5, Dartford 1, Rochester 2, Lewes 6, Brighton 3, Southampton 2. In the Eastern and South-Midland counties the disease is scarcely noticed; in Devonshire, Exeter and its environs suffered to some extent; thus, 8 persons died of the disease in St. Leonard; 30 in Kenton, including 26 in the county lunatic asylum. The 8 deaths in St. Leonard occurred close to the river Exe, which receives all the sewage of Exeter, and is dammed up by a weir at the fatal point. The deaths in the lunatic asylum demand explanation. Teignmouth on the coast had 7 deaths from cholera; Brixham, the fishing town at the entrance of Torbay, supplied with bad water, 30; a small parish in the Crediton district called Zeal-Monachorum, on a tributary of the Tay, 15; St. George in Bedminster 12. These isolated outbreaks were rendered fatal by local causes. In the midland counties of the north and west a few deaths are noticed. In Chester (Great Boughton) 83 deaths from cholera, 42 from diarrhœa occurred; the water with singular irrationality having been for some time taken at a point in the river immediately below the inflow of several of the town sewers. Cholera, which had been so fatal in Liverpool, subsided after having caused many deaths, and the epidemic caused 30 deaths in the township of Ince, where the water was bad, but scarcely touched Manchester or Salford. In Doncaster, with sewage in the waters, it raised the mortality above the average. Three fatal cases of cholera occurred at Beverley; the first case, that of a man, was imported; the others were respectively the wife who had attended the man, and the wife's sister by whom the wife had been attended. Due precautions should be inculcated in such cases. Hull and Sculcoates, which in former epidemics suffered so severely, now escaped with comparative impunity. In many towns and colliery villages of Durham and Northumberland cases of cholera occurred in considerable numbers; 107 persons died of cholera in Tynemouth and 27 of diarrhœa. The hygienic conditions are of the worst description, and the authorities often appear to slumber in the presence of danger. While the industry of Wales is making rapid strides, its sanitary condition is rapidly deteriorating, as due arrangements are not made for the accommodation or instruction of an increasing population; and thus in a country every way by nature favourable to health, both as regards air and water, epidemics find footing and prove destructive. In Tredegar sub-

district 82 persons died of cholera; in Ystradyfodwg 24; in Aberdare 29; in Ystradgunlais 50; in Llangafelach 31; in Swansea 55; in Holywell, where a well was polluted with sewage, 39; in Carnarvon, 70; in Holyhead, 25. Following fevers and other zymotic diseases there can be no question of the evil, which may well attract the attention of Welsh patriotism.

The returns contain many examples of the efficacy of hygienic measures, and afford strong proofs of the doctrine that if England has suffered less from cholera in the present year than the Continent, or less than England herself in former years, it is mainly due to changes which all Europe can appreciate and adopt.

Among other instances the Black country, as it is called, about Wolverhampton, may be cited. The epidemics of 1849 and 1854 destroyed in five districts more than three thousand lives, while in the year 1866 the mortality has been inconsiderable. The water was formerly impure, and could only be obtained with difficulty in a country covered with pits and works. But the people with commendable energy have brought good waters from a distance, and are reaping the advantages of the change in Wolverhampton, Bilston, and the other towns.

The mortality in all the country districts of England was at the rate of 19; in the town districts at the rate of 24, in 1000; but in both town and country below the average in nearly an equal degree. In the divisions the mortality of the quarter was lowest (18) in the eastern and south-eastern counties; highest in the northern counties (25), and in Lancashire and Cheshire (27), where the rate exceeded that of London (24).

The thirteen great towns of the United Kingdom stand thus arranged in the order of mortality for the quarter: Bristol 21, Birmingham 22, Hull 23, London 24, Sheffield 24, Salford 26, Leeds 28, Glasgow 29, Manchester 30, Edinburgh 30, Liverpool 33, Dublin 34, Newcastle-on-Tyne 37.

The United Kingdom in the Year 1866.

In the United Kingdom 1,013,746 births and 665,562 deaths were *registered* in the twelve months, thus making the natural increase 348,184, or at the rate of 953 daily. The recorded number of emigrants was 204,882, or 561 daily. The difference between the emigrants and the registered natural increase was 392 daily.

The birth-rate per 1000 of the year was 35·48, the death-rate 23·01, for the United Kingdom, after a correction for the defective registration of Ireland.*

The birth-rate per 1000 of England proper was 35·54, the death-rate 23·61; the numbers for the previous year, 1865, are 35·63 and 23·41; the shade of excess in the death-rate of 1866 being due to cholera, for the mortality is lower in all the divisions except those in which cholera prevailed.

The eleven divisions may thus be arranged in the order of annual mortality: the deaths per 1000 were in the South-Eastern Counties 19, Eastern counties 20, South-Midland counties 20, South-Western counties 20, North-Midland counties 21, West-Midland counties 22, Monmouthshire and Wales 23, Northern counties 24, Yorkshire 26, London 26, North-Western counties (Lancashire and Cheshire) 29.

---

* In calculating the birth-rate and death-rate, 1-third has been added to the births, 1-fourth to the deaths registered in Ireland; so that, while the registered births and deaths are 1,013,746 and 665,562, the estimated numbers corrected for defective registration in Ireland become 1,062,492 and 688,960. The natural increase on the corrected numbers was 1,023 daily, and the difference between the emigrants and the natural increase on the corrected numbers was 462 daily.

Health of London in 1866.

LONDON is growing greater every day, and within its present bounds, extending over 122 square miles of territory, the population amounted by computation to 3,037,991 souls. In its midst is the ancient city of London within and without the walls, inhabited at night by about 100,000 people, while around it, as far as a radius of 15 miles stretches from Charing Cross, an ever thickening ring of people extends within the area which the Metropolitan Police watches over, making the whole number on an area of 687 square miles around St. Paul's and Westminster Abbey 3,521,267 souls.

This population has many interests in common as regards water, air, sewage, lighting, streets, railways, poor, government, as well as police; and many of its members, residing in the outer zones at night, transact business by day in offices, shops, markets, courts, clustered in the centre of the metropolis. Thus there are daily currents inwards and outwards, and the people are blended together in a thousand ways, so as to form a natural community.

The national census is taken in England to show in each place the numbers found during the census night, as they represent the population with which the deaths and other important statistical elements can be compared. The corporation of the city of London, however, very naturally struck by the significance of the fact that the population returned at the census within the ancient limits under the jurisdiction of the Lord Mayor was only 113,387, and was constantly declining, so that in a few years he might appear to be left, by night, the lord of an empty realm (*inania regna*)*, determined to take a census to catch the throng of people in the city during the day. This has been done with considerable labour, and the results are published in an interesting report by Mr. Lawley and by Mr. Scott, the Chamberlain.† They show by their day census in April 1866 that 283,520 persons reside during the active hours of the day in the city of London where only 113,387 persons were found by the national census on 8th April 1861, and where, at the rate of decrease observed between 1851 and 1861, there could have been no more than about 102,887 in the middle of 1866. The classes that come and go, they say, "comprise some of the most influential, wealthy, and enterprising of our fellow countrymen; bankers, merchant-princes, brokers, and wholesale traders, carrying on business which has no parallel in the world, and contributing in the aggregate a larger share of the public revenues than any, and even

" than all similar classes in other parts of the empire."* This is true enough, but the reporters probably underrate the residents when they go on to say that " the night population of the city consists to a great extent " of the caretakers of city premises and their families, and of tradesmen " and others too inconsiderable to possess a suburban or other residence," for the census shows among the night population a number of clergymen, lawyers, physicians, surgeons, merchants, and respectable tradesmen, who, it is to be presumed, form a chief part of the constituency of the wards by which the 232 common councilmen and aldermen are elected. The reporters enumerate 679,744 passengers into the city in the 16 hours between 5 a.m. and 9 p.m., a number necessarily greater than the number of *persons* entering, as the same person often enters and is counted more than once. A similar but a less extensive movement of the people to and from Westminster and the other central districts of the metropolis is going on: in Manchester, Liverpool, and all the large cities of the kingdom, the same thing is met with. The great boroughs overflow on all sides.

While the other towns of the kingdom are mainly governed under the Municipal Act by councils elected by open voting (5 & 6 Wm. IV. c. 76.), the city of London is left in the enjoyment of its ancient privileges, and the rest of the metropolis is governed by 38 parish vestries or boards under the provisions of the Metropolitan Management Act (18 & 19 Vict. c. 120.) The government in the 38 bodies consists of 2279 vestrymen elected by ballot. The city of London has a common council of 232 members, including the Lord Mayor and 25 aldermen. The metropolis has thus, in the aggregate, 2511 members in its 39 Parliaments. Each district, as well as the City, sends one or two members to the Metropolitan Board of Works, consisting of a chairman and 45 representatives. Every district is bound under the Act of Parliament to appoint one or more health officers; and St. George, Hanover-square, has appointed 2, Poplar 2, Wandsworth 5, Plumstead 4, and each of 34 districts 1, making in the aggregate 47 medical officers, who have rendered the people of London excellent service during the year. Woolwich has some pretence for not appointing a medical health officer, and has availed itself of the privilege.

The jurisdiction of the Metropolitan Board of Works extends over the whole area of the London registration division, except Mottingham; it also takes in the hamlet of *Penge*, which is in the Croydon registration

* Mr. Haywood, Engineer to the City Commission of Sewers, says, in an extract quoted by the reporters,—" There are 68 members of Parliament who have offices within the city, and are to be found there daily throughout a large portion of the year."—Report, p. 14.

† This Table is compiled from the Weekly Returns made by the Registrars of London, and relates to the 52 or 53 weeks of each year.

district, and contained around the Crystal Palace 5015 people in 1861, on an area of 840 acres. The rateable annual value of property by the county rate assessment for 1867 is 15,261,999*l.*; the amount required by the Metropolitan Board for that year from the several parishes is 222,167*l.*, including 26,380*l.* from the city of London, which enjoys an annual income from all sources of about 200,000*l.**

The main drainage sewers, with the exception of the northern low level, are now in active operation. They were commenced in January 1859, and formally opened on April 4th, 1865. The length of these main sewers is 82 miles; and with the pumping stations and other works cost about 4,200,000*l.* They carry off the drainage of about 117 square miles, having a population estimated by the Board at 2,800,000. The sewage intercepted daily amounts to 14,000,000 cubic feet, equivalent to 396,406 cubic metres, or to about as many tons by weight;† the quantity discharged at Barking from the sewers north of the Thames being to the quantity discharged from the southern sewers at Crossness in the proportion of 10 to 4. The report of the Board justly refers to the necessity of a constant and abundant water supply for London, both for domestic use and for the purification of the sewers; but it does not refer to the defect in that part of the present drainage system which is under the control of the vestry-boards, and still deprives the people of the full advantages that the main drainage is destined to bestow.

The mortality of London was above the average in nearly all, except the west and the south districts; but the excess in the east districts was exceptionally great, for it was 34 instead of 26 per 1000, owing to a violent explosion of cholera in the field of the East London Water Company.

Fourth Quarter	1429	46·2	11·7	3·8	5·4	2001

‡ For the years 1849-59 the results are only approximative, having been reduced to Robinson's Anemometer from observations made with Whewell's.
§ By Robinson's Anemometer.

13,054 of the 80,453 deaths in London took place in public institutions; 7,088 of them in the 46 workhouses under the control of the vestries and boards of guardians; 4980 in the London general and special hospitals; 95 in prisons.

The meteorology of the year presented some peculiarities. The mean temperature was half a degree above the average of 25 years; but it was not so cold in the winter and autumn, nor so warm in the spring and summer months as usual. The mean temperature of June was above the average of that month; the mean day temperature at Greenwich having been 73·2°, the mean night temperature 52·0°. The wind blew 142 days from the West; 60 from the East; 101 from the South, and 62 from the North. The daily amount of horizontal movement was 274 miles; while in the previous year it was 222 miles. The rainfall was 30·5 in., which is 6·8 in. above the average.

Average Number living to One Death annually (1840-66) . .	41	44	44	40	38	40

NOTE.—The Annual Rate of Mortality in this Table is deduced from the Population at the Censuses of 1841, 1851, and 1861, and from the Deaths registered in London in each of the several years.

The Mortality for LONDON in each year, 1840-66 is calculated on the Deaths for the complete years, instead of for 52 or 53 weeks.

LONDON.—**Mean Mortality per Cent.**

TABLE 57.

POPULATION OF THE UNITED KINGDOM,

with Army, Navy, and Merchant Seamen abroad belonging thereto.*

Middle of Years.	PERSONS.	MALES.	FEMALES.
1801 -	**16,302,410**	8,096,082	8,206,328
1811 -	**18,532,522**	9,194,348	9,338,174
1821 -	**21,300,573**	10,519,256	10,781,317
1831 -	**24,423,588**	12,004,025	12,419,563
1841 -	**27,077,095**	13,325,889	13,751,206
1851 -	**27,764,034**	13,656,998	14,107,036
1861 -	**29,358,927**	14,397,427	14,961,500
(Estimated.) 1866 -	**30,339,861**	14,784,947	15,554,914
1867 -	**30,551,276**	14,864,733	15,686,543
1868 -	**30,763,648**	14,944,968	15,818,680

* In estimating the number of men in the Army, Navy, and Merchant Service abroad, a certain proportion belonging to foreign countries and the colonies has been excluded. In 1811 the troops and seamen were 640,500, but as this number included natives of colonies and foreign parts, only 502,536 were taken.

[The above numbers (1801–61) have been deduced by raising the enumerated population of the United Kingdom, including the islands in the British Seas, (*see* Table 9. p. 84. of Vol. III. Census of England and Wales, 1861,) up to the middle of the respective Census years. In 1866, 1867, and 1868 the numbers have been estimated by adding the population enumerated in the islands in the British Seas in 1861, and the number of men in the Army, Navy, and Merchant Service abroad, (*see* Tables 3. and 16. pp. 81. and 87. Vol. III. Census 1861,) to the population for 1866, 1867, and 1868, returned in Table 59. pp. lxx–lxxi.]

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

the Act of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1866.

† Where the parties to a marriage are of different religious persuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions; in these cases the two ceremonies are entered as two marriages. This column also includes 23 cases of marriage after divorce, viz., 9 *divorced men* who married spinsters, 5 *divorced men* who married widows, 8 bachelors who married *divorced women*, and one widower who married a *divorced woman*. For the districts in which these marriages took place see subsequent pages.

* In the other 63,163 cases the column of the Register headed "Age" is filled in by the Officiating Minister or by the Registrar of Marriages with the words "of full Age," "Minor," "Under Age," as the case may be ; thus losing the additional means of identification afforded by a precise statement of the age of persons at the time of marriage.

AGES of 4,826 BACHELORS and 4,826 WIDOWS who intermarried in 1866.

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

† Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1866—*continued.*

* The *Districts* are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 641 in number, are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by *H* for Hospital or Infirmary, *L* for Lunatic Asylum, and *w* for Workhouse situated out of the District to which it belongs; and repetitions of these letters show the number of such Institutions in any District. The smaller Institutions are not noticed.

† For a table of the Deaths in the principal *Public Institutions* situated in the Districts of London *see* pages 83-4.

‡ Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.

* The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter *W* denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; *w* indicates that a Workhouse belonging to *another* District or Union is included; *H* indicates Hospital or Infirmary; and *L* Lunatic Asylum.

† For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.

‡ Wherever the minus sign (−) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated. The Excess of *Deaths* over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 114 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a *few persons*, or *diseases* which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Where it is desired,

CAUSES of DEATH at different Periods of Life, in the Year 1866.

partial correction, however, can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as chicken-pox, mumps, epistaxis, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120–125.]

*Note.—In calculating the average annual rate of mortality from all causes in London, a correction has been made by distributing the deaths in *hospitals* proportionally over every district. The second rate of mortality (in figures of different character) is the result of a further correction,—in Chelsea and Greenwich for the Military and Naval Hospitals, in Wandsworth for the County Lunatic Asylum, and in the other London Districts for Workhouses situated out of the Districts to which they belong.

In all the other Districts of England the second rate of mortality is the result of a correction for either a Naval or Military Hospital or Camp, a County Lunatic Asylum or a Workhouse situated out of the District to which it belongs. The particulars of these corrections are given in the Supplement to the 25th Report, pp. xl-lviii.

Population 1861, Average Annual Rate of Mortality from All Causes in the Ten Years 1851-60, and Deaths from several Causes in the Year 1866, in the DISTRICTS of England—*continued.*

* The mortality for Pontypridd is returned with Cardiff and Merthyr Tydfil.

APPENDIX.

Letter to the Registrar General on the Causes of Death in England, by William Farr, Esq., M.D., F.R.S.

Year 1866.

Sir,

As cholera was epidemic, it has, although it was combated with success, raised the mortality of the zymotic diseases above the average. This does not, however, account for the whole of the excess in the mortality, which was diffused in various degrees over all the classes of malady.

Of the total the causes were not specified in 8578 deaths, of which 3585 were returned simply as sudden death or found dead, 4993 as from causes either not specified or ill-defined.

A considerable number of the deaths are uncertified by medical men, as they are not in all cases in attendance up to the date of death; and this defect can only be remedied by the appointment of a registration medical officer.

The returns of the causes of death at coroners' inquests are much more explicit than they were formerly; and if the coroners carry out the suggestions in the letter which you have addressed to them, the utility of their office will be greatly enhanced. *See Letter, pp.* 198–204.

I. Zymotic Diseases.

115,972 deaths were referred to this great class, which is thus the cause of 23 in each 100 specified deaths. The mortality by zymotic diseases is 5·5, or nearly 6 to 1000 living.

The miasmatic order of diseases alone was fatal to 110,059 persons, 31,548 of whom perished by cholera or diarrhœa. This important epidemic of cholera is described in the Supplemental Report.

Though scarlatina is subsiding to a considerable extent, it proved fatal to 11,685 persons; while diphtheria still maintains its hold in various parts of the country. Excessive mortality from either of these maladies implies great defects of the conservancy; this is notably the case in Bangor, Holywell, Newcastle-upon-Tyne—an unclean town, and an old offender against the laws of health; here 490 people, chiefly children, perished. Gateshead is less criminal on this score, yet there 98 children and others died; Lancashire and the West Riding of Yorkshire felt the scourge severely. In Birmingham were 292 deaths from scarlatina, 57 from diphtheria. In Dudley were 119 deaths by scarlatina; in Yarmouth 71; in London 1892. The disease in London is thus exceedingly fatal; but it is still more fatal in Lancashire and Cheshire. The progress of scarlatina and of the allied diseases is shown in Tables 2, 3, 4; while Table 5 displays its distribution over the counties in each of the 15 years 1852–66.

Fevers are also fatal forms of disease in England, and deserve great attention, as they affect not only children, but men in the prime of life, and might by judicious measures be prevented to a considerable extent. Three forms of continued fever have been distinguished by the analytical pathology of Sir William Jenner, Dr. Murchison, and others; and the knowledge thus acquired is now so diffused, that when the nomenclature of disease, which has been framed by a committee of the College of Physicians, is circulated, these three forms may be distinguished. By Table 8 it will be seen that the attacks, as might be expected in a

disease commonly attacking men only once in life, declined from the early ages, when at age 5–10 full 144 in 10,000 were attacked, down to 50 at the age 25–35; to 37 at age 35–45; to 26 at age 45–55, and so on to the last ages. Through the changes in the rate of mortality among the patients at various ages, the deaths to 10,000 living decreased to the age 10–15; remained nearly stationary at about 9 in 10,000 for the next three decenniads of middle life, and then increased slowly. The mortality at all ages was 10 deaths in 10,000 living; and there is no apparent evidence of decline in the rate of death from fever. That *typhia* (typhoid fever) is sustained by the increasing contamination of the waters, and typhus by the increased density of population is exceedingly probable.

The *enthetic* order of diseases is growing more fatal; 1662 deaths from syphilis are recorded, 191 from stricture of urethra, a common result of gonorrhœa. Hydrophobia which had been fatal to one, two, three, or four persons in the seven years from 1857 to 1863, became fatal to 12, 19, and 36 in the three years ending in 1866. The dietic and parasitic orders of disease present little to notice specially except a slight decrease in the deaths from delirium tremens.

II. Constitutional Diseases.

The deaths from constitutional diseases vary little in number from year to year. They amounted to 89,907, of which 17,482 were diathetic, and no less than 72,425 tubercular. Consumption alone caused 55,714 deaths. The mortality by consumption was at the rate of 2·653 to 1000 living; being less than the mortality by the same disease in 1850–54, but more than the mortality in the ten years following.

III. Local Diseases.

This class of disease includes all the recognized inflammations, which give rise to general derangements both of the nerve force and of the circulating blood, but produce specific changes of particular organs, and may hence be called monorganic. Pus is the characteristic product of inflammation when it goes through all its phases; and the secretions of the liver, of the kidneys, and of the other glands, are necessarily affected by the process. All the altered secretions of organs such as diabetic urine, or modifications of nutrition such as hypertrophy, or derangements of function such as insanity or convulsions, are referred to this class. So are such mechanical displacements as hernia or intussusception.

The deaths, 192,444 in number, are returned under eight orders: 61,164 as diseases of the brain and its appendages, 22,190 as diseases of the organs of circulation, 77,249 as diseases of the respiratory organs, and 21,084 as diseases of the digestive organs. The deaths under the other four orders, except those under the urinary organs 6621, are not so numerous, as they affect parts less essential to the individual life. It is remarkable that the deaths ascribed to apoplexy and to paralysis respectively have from the first been very nearly in equal numbers, and were in the year, for apoplexy 10,297, paralysis 10,504. These are diseases incidental to old people: the inflammations of the brain and spinal marrow affected chiefly but not exclusively young children.

The mortality from the great order of respiratory diseases (*pneumatici*) has progressively increased since the 5 years 1850–54 from 2·769 per 1000 living to 3·409 in 1860–64; and to 3·678 in 1866. The increase is chiefly in bronchitis, and it corresponds with a decline of the deaths referred to phthisis, with which, in its chronic forms, it was confounded.

The increase of the deaths from the mortality by the two diseases proceeded regularly from 3·827 to 4·006, and to 4·225 in the three

quinquennial periods that ended in 1864; in 1866 it went up to 4·621. Taking the sum of the mortality from phthisis and all the respiratory order of diseases, to avoid any ambiguity, the mortality for the same years was 5·580, 5·803, 5·976, and 6·331. The cause of this increase deserves to be carefully studied. In the meantime it is worthy of note that dusty particles inhaled do unquestionably excite disease, sometimes called "grinder's rot," or stonecutter's asthma, or other names; and that the smoke of towns, and the dust of the atmosphere in shops, and the shut-up life in chambers are increasing as towns increase. It is a matter of general concern to diminish the smoke. This has been effected to some extent under the pressure of legislation; but the cure may be carried much further; it may be extended not only to the fires of manufactures and steamers, but to the chimneys of private houses, which vomit smoke into the atmosphere. The simple method of lighting the fires from the top diminishes the smoke to a great extent, and should be taught, as it requires some skill; the chief obstacle to success being the prejudice of many of the domestic servants left uneducated, who will be replaced in time by others better instructed.

Some diseases that always existed have only recently been distinguished from others with which they were liable to be confounded; this is the case as regards certain affections of the heart. *Nephria*, which was first discovered by Dr. Bright, and on that account is still by some called Bright's disease, *morbus Brightii*, is a striking instance. The recognized mortality on 1,000,000 for three successive quinquenniads of time was at the rate of 32, 54, and 78; in the year 1866 it was 97.

Surgery has made great progress recently; and it is gratifying to see in the registers traces of its beneficent effects. Hernia indeed is still as fatal as it ever has been since 1850, but this is probably due to the negligence of the patients and their friends in not applying in time to the surgeon. The mortality by stone has fallen considerably since lithotomy was introduced; and we would gladly hope that the increase of cystitis is not referable to the want of skill in unpractised operators. Ovarian dropsy, another painful and desperate disease, is less fatal than it was since ovariotomy has been skilfully practised, for out of 250 patients operated on by only one surgeon (Spencer Wells), 180 recovered, or 72 per cent.; the proportion of recovered was the same in the small Samaritan Hospital; even in six of the large London hospitals 32 out of 83, that is 39 in 100, recovered after the operation.*

IV.—Developmental Diseases.

These diseases incidental to development, growth, and decay are chiefly fatal in infancy and in old age, except in females who die of childbirth.

To the first order of congenital malformations and developmental diseases of children, 14,634 deaths are referred. 8943 of the deaths are designated premature births, and properly belong to the fœtal mortality. A certain number of the untimely born survive for a time, and a certain number attain maturity. Some malformations are necessarily fatal in intra-uterine life; others are not necessarily fatal for some years; and among them may be classed *cyanosis*, the *blue disease*, from the mingling of venous with arterial blood, and *spina bifida*, to which 514 and 413 deaths are referred, while the deaths ascribed to other malformations are 471.

When the new classification was adopted in 1858, debility, which had been returned with premature birth down to 1857, was separated from it and joined to "atrophy" under diseases of nutrition. The sum of the deaths from premature birth, debility, and atrophy was 34,752 in the

* Medical Times and Gazette, February 22, 1868.

year 1857, and 34,167 in the year 1858; so above 11,000 deaths registered as debility were transferred from the first to the fourth order.

The deaths ascribed to old age have been very constant; in the year they amounted to 28,546.

V.—Violent Deaths.

The violent deaths amounted to 16,915 The number increased from 13,852 in the year 1857 to 17,374 in the year 1865, and in the year following declined.

Every one of these deaths is of extraordinary importance. Twelve were public executions; 480 were, according to the findings of coroners' juries, manslaughters and murders. Then 1329 were suicides. Suicides fluctuate little; but the proportion of 64 to 1,000,000 living in the year is the lowest proportion, while 70, the rate in the year 1860, is the highest on record since 1858.

The increase of deaths by accident and negligence measures to some extent the increase of the chemical and mechanical forces which are every year in use, as it is some time before the workmen and other persons in contact with the several agents learn to manage them and to bring them under control. Machines, or compounds from which force explodes, are at first like vicious, unbroken horses; and to signalize the dangers creates caution, while it turns the minds of inventive men to the discovery of remedies.

In the 15 years, 1850–64, the deaths by violence of every kind, including accidents, negligence, suicide, murder, were in the proportion of 753 to 1,000,000 of the population; that is, of rather more than 7 to 10,000 living. The proportion in the three periods of five years were 746,742, and 770 in 1,000,000. The increase began in 1863, when the proportions rose to 772, and in the three years following to 826, 835, and 807.

Since the year 1858, the several causes being distinguished, each class of causes can be followed, and it will be seen that deaths by burns and scalds, to which attention has every year been directed in these reports, attained their maximum in the years 1858–60 of 162, 153 and 161 burnt or scalded to death in those years to 1,000,000 of population; the deaths then fell progressively to 121 in the last year. At the same rate as prevailed in the year 1860 the deaths by burns and scalds, instead of being 2533 would have been 3415. Thus by some means or other, but undoubtedly of a very simple character, about 882 lives in one year were saved from the fire.* It was shown that woollen and worsted dresses,

---

* Note.—Subjoined are the suggestions for preventing death by fire, which I reprint from the letter in your 24th Report, published in 1863.

"1. *Open fires*, lights, and kettles of hot water, should be surrounded by good guards. This precaution is of capital importance.

"2. Children and young people, and old women, should be systematically taught the danger of fire.

"3. The dresses of young children and old women should be made as much as possible of worsted or wool; which will protect them against cold, as well as against fire.

"4. The muslin dresses, and cotton and linen clothes, might very properly be starched with the chemical materials which are found by experience to render them, to a certain extent, incombustible.

"5. Private houses should all be provided on each floor of the sleeping apartments with the means of escape, in the event of the lower apartments taking fire during the night. Especial provision to be made for women and children.

"6. Fireworks, powder-works, and chemical manufactories require special precautions,

"7. Persons falling asleep near the fire, or near lights, in a state of intoxication, or in fits, are frequently burnt to death.

"8. Young children drink scalding water out of the spout of the tea kettle, or fall into scalding water. This happens often in the lower classes, when the mother is out at work, and the young children are left at home alone. The means of obviating this danger are evident.

"9. Special arrangements are, it is scarcely necessary to add, required for preventing the explosions of mines or of steam engines."

being less combustible than dresses of other materials, are the safest clothes for children to wear; and it is possible that the substitution of wool for cotton textures has had some effect on the deaths by burns. Dr. Lankester and other coroners have contributed and may contribute still more to the diminution of fatal burns by cautioning the public at every inquest held on the unhappy victims.

The deaths by poison have also decreased from 26 in 1850 to 19 in their proportion, and this is fairly referable to the better regulations for the sale of poisons, and to the greater precautions of the chemists and druggists. Still further restrictions and precautions are required to reduce poisoning to its lowest pitch. 406 deaths by poison, that is, 278 by accident or negligence, according to verdicts, and 128 by suicide, make a large number. If science discovers poisons it is its duty, as it is indeed more congenial to its nature to discover safeguards and antidotes.

It is well worthy of note that although deaths by accident attract adequate attention when many persons are killed at the same instant by great explosions in coal mines or by formidable collisions on railways, the causes of the greatest number of deaths escape public notice. Thus if explosions are dangerous in mines, the fall of stone and of other materials which knock men on the head one by one at intervals are much more fatal. So street accidents by horse-carriages kill more people in the year than railways. In this class of cases the publication of the registered facts brought these occult evils to light, and will in the end, we may hope, lead men to the discovery of remedies.

Twenty deaths by lightning were registered in the year. They are as usual given in detail.

I have the honour to be,
Sir,
Your very obedient servant,
WILLIAM FARR.

To
The Registrar General.

TABLE 1.—**Excess** or **Defect** of **Annual Rate** of **Mortality per Cent.** of **Males** and **Females** in **England** and **Wales** in the **Year 1866** over or under the **Mean Annual Mortality** of the **29 Years 1838–66.**

	AGES.—MALES.											
	ALL AGES.	0–	5–	10–	15–	25–	35–	45–	55–	65–	75–	85–	95 &upwds

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

‡ The number of persons executed in the several years will not necessarily correspond with those in the same years of the "Criminal Returns," inasmuch as the executions recorded in each year in the latter are derived from the dates of conviction, while the numbers in this Table are classed under the years in which the deaths are registered.

§ The cases of angina membranacea which would now be put to diphtheria were formerly classed under the same head as scarlatina, but were distinguished in the notes.

TABLE **11.—Causes** of **Death** registered in **England** in each of the **Ten Years 1857-1866**—*continued.*

* Up to the end of the year 1857 cases of so called "debility" and "premature birth" were classed together; when the new classification was introduced "premature birth" was kept apart, and "debility" and "atrophy" were thrown into one line. This accounts for the changes in the table numbers.

TABLE **12.—Causes** of **Death** registered in **England** in each of the **Seventeen Years 1850-1866.**
To 1,000,000 PERSONS LIVING the DEATHS from each CLASS of CAUSES, and from each CAUSE.

† In the years 1850-57 cases of so-called "debility" and "premature birth" were classed together; when the new classification was introduced "premature birth" was kept apart, and "debility" and "atrophy" were thrown into one line.
‡ For the years 1858-66 the number of deaths in which the cause was not specified was distributed *pro rata* over all the causes in the Table.

TABLE **13.—Causes of Death in England in 1866.** Proportional Numbers dying from each Class of Causes, and from each Cause.

* The Mean Annual Mortality in the 15 years from All Causes and from Specified Causes is the mean of the three quinquennial periods, and does not correspond exactly with the totals of the Orders and Classes; because under certain heads, for example, *Homicide*, *Suicide*, and *Causes not specified*, &c., the complete details cannot be given for the entire period.

† Mean of 3 years.

‡ Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

§ Mean of 2 years.

NOTE.—In a certain number of cases in each year the cause of death was not stated. In calculating the proportional numbers, since 1855, they have been distributed pro ratâ over all the causes in the Table.

TABLE **14.—Mean Annual Rate of Mortality** from each CLASS of CAUSES and from each CAUSE during **Three Periods of Five Years; and Rate of Mortality** in the Year **1866**—*continued.*

* This death was registered on 19th January 1866.

LETTER TO CORONERS.

General Register Office, Somerset House,
5th March, 1868.

SIR,

I HAVE the pleasure of transmitting to you a copy of my "Official List" for 1868, which you will probably find useful in your frequent communications as Coroner with the Registrars of Births and Deaths.

As you are doubtless aware, a column in the Death Registers is reserved for "Rank or Profession;" but, though accurate descriptions of occupation and social status are of great importance for the identification of individuals, and also for statistical purposes, the particulars required to be entered in that column have not hitherto been recorded in a very satisfactory manner. If you will be so good as to refer to pp. 450–1 of the Official List you will perceive the general nature of the defects to which I refer, and will learn also the nature of those improvements that are found to be most needed. I should be much obliged if I might rely in this matter on your co-operation, which you will render by filling up "Coroners' Informations" in such manner as may best enable the Registrars to carry out my instructions.

It is also an object of the greatest importance that in that numerous class of cases which fall under the investigation of coroners' juries full and, as far as may be consistent with convenience, detailed statements of the *Cause of Death* should be furnished to Registrars. In many of the "informations" received in the last thirty years all the facts that can be useful have been supplied; and it is only requisite that the practice now partially existing should be extended and made uniform to render the working of the system quite satisfactory.

It cannot be doubted that deaths by "accidental violence"—under this term being included all fatal violence except that which arises from express homicidal intention—have much increased within the present century. The introduction of steam as a moving power, the wonderful extension of railway travelling for business and pleasure, the redoubled activity of manufacturing and mining operations, of navigation, agriculture, and general traffic, the multitude of poisons in medicine and the arts accessible to old and young, the manufacture of explosive substances, the direction of new forces and modes of action in the hands of rash and inexperienced persons, and under the urgency of commercial considerations,—have inevitably destroyed the lives of thousands, who, fifty years ago, would have succumbed to death *in a natural manner*. Science itself creates new instruments of death; and it is imposed on science, as a correlative obligation, that it should surround human life with new defences. But wrongs must be known that remedies may be found; and in that wide and various field of experiment which is co-extensive with national life and activity individual facts, and facts in their innumerable modifications and combinations, must be observed and recorded, that correct and useful results may be obtained. The lives of the people have become a chief subject of public concern; and the questions are now put in respect to every individual in the realm: When, and where was he born? What occupation did he follow? When, where, and in what manner did he die?

In the 15 years 1850–64 the average annual number of deaths to each million of the people living was 22200·2.

From 1. ZYMOTIC diseases	- - 5064·0	deaths to	1,000,000 living.
2. CONSTITUTIONAL diseases	- 4368·0	„	„
3. LOCAL diseases	- - 8148·8	„	„
4. DEVELOPMENTAL diseases	- 3595·1	„	„
5. VIOLENT deaths	- - 752·5	„	„
6. SUDDEN deaths	- - 177·2	„	„
(Including persons "found dead," and generally subjects of inquest, where the cause of death was not ascertained.)			
7. CAUSES not specified	- 214·8	„	„

The first and the fifth classes, viz., zymotic diseases and violent deaths, may be considered to represent the loss of life in modes and proportions that are most subject to human control.

In 1865 there were 490,909 deaths registered in England. This was the total number from specified and unspecified causes,—from all diseases, and forms of violence. The violent deaths were 17,374; they were 835 in every million of the population; and they bore a proportion of 35,772 to a million deaths from all causes. Of the 17,374 there were of homicide 443 cases, of suicide 1392, of executions 6; and of deaths expressly stated to have been from accident or negligence—also deaths not thus described in the returns, but, on view of the facts, assumed to be accidental—and of deaths, the proportion of which is very considerable, which could not without great licence of conjecture be referred to homicide or suicide, such as "killed by a blow," "found drowned," "child found suffocated in bed," &c., the total number was 15,533.

From accidental fractures and contusions there were 6,843 deaths in 1865; from accidental gunshot 112, from suicidal gunshot 58; from accidental cut or stab 93, from suicidal cut or stab 252; from burns and scalds 2,713; from accidental poison 273, from suicidal poison 135; from accidental drowning 2,823, from suicidal drowning 230; from accidental suffocation 1,309, from self-hanging 591; by other accidental modes 1367; suicide by leaping from a height, or means not defined, 126. In an unascertained, but what should be an ascertainable, number of cases the evidence failed, and necessarily the verdict was in the same degree defective; in perhaps an equal number of cases, where the finding was complete, the information to the Registrar may have suffered mutilation in essential points by inadvertence or want of skill in transcribing it.

But if it is desired to establish a basis on which the investigation of questions of sanitary police may be conducted, the analysis must be carried further; and whether this is practicable, and how far it will be really useful in preventing crime, advancing medical science, and improving the public health, depends on the inquisition into the causes of violent and sudden deaths which must be searching, and on the record of facts which must be complete. In railway accidents how many persons were killed in a year and a series of years? How many of these fractured, contused, or concussed by collisions? How many by carriages running off the rails? How many by being run over on the line? How many by explosion of boilers, breaking of axles, tires, and the like? In how many cases was the administration at fault? In how many was neglect of regulations, unsoundness of material, insecurity of the permanent way, or other defect, the primary cause of the fatal result? Mines should be distinguished as coal, copper, tin, iron, &c. How many miners suffered death by fall of coal, stone, &c. on their bodies? How many in blasting? How many by falling in shafts, from breaking of ropes or other parts of machinery? How many by fire damp, choke-damp? How many burnt, suffocated, drowned? How many by trucks, and other carriages? Railways used strictly for conveyance of coal and mining purposes should always be distinguished from the main and branch lines which traverse the

country, and which, whether the "North-western" or the "South-eastern" or other, should appear under their proper appellations. How many deaths of workpeople were in factories? How many by machinery of cotton, flax, paper, flour mills and saw-mills, and by agricultural machinery? All of which should be distinguished. How many persons were fatally injured by horses and carriages in the streets? And of these how many by waggons, omnibuses, cabriolets? How many by falls from ladders or scaffolds? How many were drowned by falling from boats, or were cast ashore in shipwrecks? How many killed by falls from the rigging, or other injury in ships and boats? How many burnt or suffocated by their clothes taking fire, or the conflagration of their houses? How many scalded in particular manufacturing processes? How many children by drinking hot water? How many killed by explosion of gunpowder, gas, fireworks? How many poisoned by quack medicines, by drugs unskilfully administered, by lead in paint, by opium, corrosive sublimate, sulphuric and other acids as used in medicine or the arts? How many children were overlaid, exposed to cold, strangled, or otherwise murdered? How many persons died by chloroform, or mephitic gases?

Subjoined to this letter are some details relating to this subject, which, with the Tables in my Reports in which violent deaths are analyzed, will show how far the descriptions of the causes of such deaths, as up to this time they have been entered in the Registers, form a sufficient groundwork for investigations of the nature indicated above; and, probably better than by any other means, will enable you to judge the exact nature and magnitude of their defects.

The circumstances in which violent deaths occur are so various and multiplied that for describing and recording them it is possible only to suggest a few general rules. In the following pages I have noticed the most important particulars required, as well as actual defects and omissions that have deprived many "informations to Registrars" of that scientific character and value which they must possess if they would satisfy the intention of the statute; and I have added some specimens of the better class of returns. But it is chiefly necessary to keep in view the important object contemplated in registering informations; and if this is done there will be no difficulty in returning the causes of violent deaths with sufficient detail, explicitness, and uniformity to admit of analysis and comparison, and furnish results that will stimulate the invention of individuals, excite the vigilance of proprietors, trading communities, and corporations, and direct the path of legislation.

It happens in numerous instances that "unknown" persons are found dead and become the subject of inquisition before the coroner, many of them perhaps professional vagrants, who have wandered friendless and uncared for all their lives, and have sunk at last to their rest in the fields. Others under the influence of insanity or sudden freak have disappeared from their homes leaving no trace by which their friends can find them. In such cases, it is desirable in the absence of better means of identification that the *apparent age, the height, dress, colour of the hair, probable occupation, &c.* should be stated in the *information*, in order that these particulars may be entered in the registers, and thus placed within reach of persons who are engaged in searching for absent relatives.

I have the honour to be,
Sir,
Your faithful Servant,
GEORGE GRAHAM,
Registrar General.

To the Coroner of

Coroner's Inquests; and Informations to Registrars.

"The court of the coroner is a court of record to inquire when any one "dies in prison, or comes to a violent or sudden death, *by what manner* "*he came to his end.*" Blackstone, b. 4, c. 19, s. 11; 4 Inst. 271; 2 Hal. P. C. 53; 2 Hawk. P. C. 42. For power of coroners to hold inquests where the *cause of death* arose out of their jurisdiction, *see* 6 & 7 Vict. c. 12.

Extracts from 6 *&* 7 *Gul.* IV. c. 86., *being the "Act for registering Births, Deaths, and Marriages in England," relative to the Duties of Coroners and their Courts under that Act.*

"In case any new-born child or any dead body shall be found exposed, the overseers of the poor in the case of the new-born child, and *the coroner in the case of the dead body,* shall forthwith give notice and information thereof, and of the place where such child or dead body was found, to the registrar."—Sect. 19.

"Provided always, That in every case in which an inquest shall be held on any dead body, the jury *shall inquire of the particulars herein required to be registered concerning the death,* and the coroner shall inform the registrar of the finding of the jury, and the registrar shall make the entry accordingly."—Sect. 25.

The particulars as given in Schedule (B) are "When died ('place of "death' was added by the Amendment Act, 1 Vict. c. 22. s. 8.); name "and surname, sex, age, rank, or profession; cause of death."

"Provided always, That the coroner, upon holding any inquest, may order the body to be buried, if he shall think fit, before registry of the death, and shall in such case give a certificate of his order in writing under his hand, according to the form of Schedule (F.) to this Act annexed, to such undertaker or other person having charge of the funeral, which shall be delivered as aforesaid; and every person who shall bury or perform any funeral or any religious service for the burial of any dead body for which no certificate shall have been duly made and delivered as aforesaid, either by the registrar or coroner, and who shall not within seven days give notice thereof to the registrar, shall forfeit and pay any sum not exceeding ten pounds for every such offence."—Sect. 27.

By the Act 21 Vict. c. 25. s. 5, the coroner is required to send *written information* of the finding of the jury to the registrar of the sub-district in which the death occurred, or in which the body was found dead. (*Forms of "Informations" will be furnished on application to the Registrar General.*)

SUDDEN DEATHS.

The authorities in medical jurisprudence state that the causes of sudden deaths, often involved in great obscurity, can be ascertained only by inspection of the principal organs. The body may have the same external appearance in death by apoplexy, syncope, aneurism, poison, or suffocation, and violence of other kinds; but if the death be distinctly traced to a disease or injury by an inspection of the body, and the question "by what manner" the person "came to his end" be thus determined, one or more of several ends is gained: the perpetration of a crime is ascertained,—or unjust suspicions are dissipated,—or in any case a reasonable curiosity is satisfied, and what may prove to be a useful fact is placed on record.

Affections of the mind often appear in the registers as causes of death, *e.g., passion, rage, fright, grief, excitement, "broken heart," anxiety.* By their wasting influence they slowly eat away life; or rising like

tempests suddenly destroy it; or acting on predisposing conditions they but accelerate the event. The following are examples:—"Shock occa- "sioned by the sudden death of her brother, who expired three months "before;" "trouble for the death of her son, who died six weeks before;" "extreme grief, caused by one of her children having been lost for two "days;" "anxiety from pecuniary embarrassments;" "illness caused by "a fright from thunder and lightning;" "fright from her clothes taking "fire." The following examples are more complete, as specifying not only the mental affection but that material and visible injury which directly proved fatal:—"Apoplexy, produced by excitement while "fighting in a state of intoxication;" "excitement and passion causing "rupture of the left ventricle of the heart."

VIOLENT DEATHS.

Care should be taken that every return of a violent death answers the threefold inquiry involved under "the Cause of Death;" *namely*,—

(1) Was the deceased killed by his own act, or by that of other persons, and in what circumstances?

(2) What were the means, instruments, or things by which the fatal injury was produced?

(3) What was the nature of the mortal injury, and what time elapsed before death?

Or it should have on the face of it an explanation of the omission.

At the same time the statement should be made as concise as it is clear and comprehensive: no vague or unnecessary word should be inserted.

Imperfect Returns of the Causes of Violent Death.

"Accident."

"Accidental"—"accidental death;" "accidental by his own careless- "ness." [*Imperfect.*]

These cannot properly be called returns of the causes of death. They neither state the *nature* of the accident nor the nature of the injury. Was the "accident" in a mine, a steamer, or a factory, or was it on a railway?—Was it fracture, drowning, a burn, or poisoning, that caused the death? It is not necessary to mention other vague returns of the same kind, which leave the same questions unanswered.

"Wilful murder;" "manslaughter;" "justifiable homicide;" "felo de "se;" "suicide." [*Imperfect.*]

All returns of this kind are imperfect. No mention is made of the means by which the "murder," for instance, was caused. Was it by strangling, a wound, a blow, drowning, shooting, or poison? In many cases other circumstances are required to be stated in order to give a correct account of the "cause of death."

"Fracture of the skull;" "fracture of jawbone;" "a burn;" "rupture "of diaphragm;" "suffocated." [*Imperfect.*]

Returns of this kind are imperfect. They give the exclusively medical view of the case. The causes of the "fractures," &c. are not specified; nor the circumstances in which the injuries happened. Were they accidental deaths, suicides, or murders?

"Lock-jaw;" "erysipelas;" "mortification;" "delirium tremens." [*Imperfect.*]

Returns of this kind are imperfect when it is not stated whether they were or were not the results of external causes, or intemperance.

"Accidentally drowned;" "accidentally crushed;" "poisoned himself;" [*Imperfect.*]

The place in which the person was drowned should have been stated. Was he precipitated into the water by the fall of a bridge or the upsetting of a boat? Was he bathing or skating, &c.? How was the body crushed, and by what? What was the nature of the poison, &c.?

"Injuries from machinery;" "fell down a coal-pit;" "explosion in a "coal-pit." [*Imperfect.*]

"By a machine." [*Imperfect.*]

The particular kind of machinery, and the names of the coal-pits or of their owners should have been returned.

"Water in the chest and pericardium, accelerated by exposure to the "severity of the weather." [*Imperfect.*]

In this return the cause and circumstances of exposure should have been stated. From destitution? Want of clothing, fire, or lodging? Did it occur in employment in the fields, on board ship, in a fishing boat, in travelling, or in what other situation?

Little can be ascertained respecting the causes of some deaths; but in such the *name of the place* in which the person is found should be stated; and it should be added whether "with or without marks of injury."

"Hydrophobia." [*Imperfect.*]

Was the disease caused by the bite of a dog, cat, or what other animal? How many days or hours elapsed between the bite and the first symptom of hydrophobia; and how many between the first symptoms and death?

"Found drowned;" "found dead." [*Imperfect.*]

In many cases the evidence is insufficient to decide positively whether the person committed suicide, fell into the water accidentally, or was murdered. In such case the *probable* cause may be returned in a qualified manner, together with the name of the river or other water; such as "drowned in the "Regent's Canal, *probably* by accident."

So of other cases, the cause, in favour of which there is a *strong probability*, should be stated with the proper qualifications. In other cases it should be stated that the circumstances are "unknown."

The following examples of Returns of Violent Deaths appear to be unexceptionably good:—

Run over by a cart in Holborn while trying to stop a runaway horse; fracture of skull and ribs; lived 10 hours.

Cut in the heel by a bar of iron which fell on him when at work nine days before death; erysipelas six days before death. [*The terms cut, stab, contusion, &c., are preferable to "wound," which is less specific.*]

Fall and dislocation of the neck, caused by the rope breaking whilst ascending the shaft of *Eddystone** colliery.

Fracture of the skull by a fall of coals in a pit in Baldwin's colliery.

Burnt by the explosion of gunpowder and other inflammable substances in a composition to be used for fireworks at ——— works.

Crushed by chalk falling on him in a tunnel on the London and Brighton railway.

Disease of the stomach, accelerated by taking brandy and salt.

Cutting his own throat, after stealing riband in a linen-draper's shop; lived one hour.

Cut through the skull, and deeply into the brain, by a circular saw in a saw mill; died in a few minutes.

Poisoning with arsenic, from exposure to it during work in the *Barnes* candle manufactory.

Erysipelas of the arm from accidental application of sulphuric acid to the fingers; lived 3 days after accident.

Killed herself by $2\frac{1}{2}$ oz. of laudanum and strangulation with handkerchief.

Killed in a prize-fight by George Anderson,—manslaughter.

Leg crushed by machinery in Samuel Smith's silk factory; lived 6 weeks; abscess 3 weeks.

Instant death by being knocked down the shaft of the *Devon* coal-pit by the swing-tree of a gin.

---

* All the names are in these examples suppositions.

Burnt in the *Barnsley* coal-pit by the explosion of fire-damp.

Lightning in the Finchley-road; lived 14 hours; symptoms like the stupor of apoplexy; no morbid appearance found in any cavity of the body; two slight burns on the fore-arm.

Hæmorrhage into the abdomen from accidental rupture of the liver by being crushed between two *Great Northern* railway waggons while at work at the *Treherne* station.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A, as Ashford, East.]

For names of Towns, such as Chester, Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 209) *and "Index of certain Towns"* (page 219).

INDEX OF SUB-DISTRICTS.

this alphabetical arrangement the principle is adopted of placing the Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G as "Grinstead, East;" St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to the order in which it appears in the arrangement of the Districts in the Tables of Abstracts; thus, Abbey Holme (569; 2) is the 2d Sub-District of the Wigton District, No. 569.]

Sub-District.	District.	No.
A		
Abbey	Bath	326; 3

ALPHABETICAL INDEX

TO

REGISTRAR-GENERAL'S TWENTY-NINTH ANNUAL REPORT AND APPENDIX.

PAGE

ACCIDENTAL DEATHS; Causes of their increase 178–198

AGES of 249,226 Persons married in 1866, distinguishing Bachelors, Spinsters, Widowers, Widows 26–27

at Death of Males and Females registered in 1866 in Divisions, Counties, and Districts 98–119

at Death of Males and Females in England registered from different Causes, in 1866 120–125

at Death of Males and Females in England registered from different Supplemental Causes, in 1866 126–129

at Death of Males and Females in London registered from different Causes, in 1866 130–135

APOPLEXY and PARALYSIS; remarkable equality maintained in Number of Deaths 176

AREA in Statute Acres of each Division, County, District, and Sub-district . 28–82

ARMY; Strength and Mortality in the Army at home and abroad . . xxvii

Annual Rate of Mortality per cent. in Great Britain, England, France, Austria, and Italy, including the Deaths of Soldiers *at Home and Abroad*, 1857–66. (Table 30.) . . . xxvii

Average Strength of the British Army at Home in 1866. (Table 31.) xxvii

Mortality of the Army at Home in 1866. (Table 32.) . . xxvii

Average Strength of the British Army Abroad in each of the Years 1863–66. (Table 33.) xxviii

Number of Deaths in the British Army at Home and Abroad, 1863–66. (Table 34.) xxviii

Annual Rate of Mortality per cent. amongst Officers and Men in the Army Abroad, 1858–66. (Table 35.) xxviii

Strength at Home and Abroad in 1861, showing the Numbers born in the different parts of the United Kingdom and elsewhere. (Table 36.) xxix

Deaths in Army Abroad of Officers and Men belonging to England and Wales and to Great Britain, 1858–66. (Table 37.) . xxix

AUSTRIA; Estimated Population in middle of the Years 1853–66. (Table 26.) xxiv

Number, and Proportion per cent. to Population, of Marriages, Births, and Deaths, in each of the Years 1853–66. (Table 27.) . xxv

Comparison of Marriage, Birth and Death Rates . . . xxiii–xxvi

Annual Rate of Mortality per cent. in the Austrian Army, 1857–66. (Table 38.) xxix

BIRTHS registered in England, in each Year, 1838–1866. (Table 1.) . i

proportion to Population in each Year, 1838–66. (Table 2.) . ii

in 1866 viii

proportion to Population viii

BIRTHS—*continued.* PAGE

of the two Sexes in England, Scotland, Ireland, and France . . x–xii

in the four Seasons xiii

Legitimate and Illegitimate in England in the Years 1845–66, and Proportion of Males to Females. (Table 9.) . . . x

out of wedlock in England and Scotland . . . . . xiii–xv

in Counties, in 1866. Numbers, Legitimate and Illegitimate, of the two Sexes; Proportions of Male to Female Births, Legitimate and Illegitimate; Proportion of Illegitimate Births to Total Births. (Table 10.) xi

proportion of Male and Female Children born in the several Counties of England during each of the Years 1857–66. (Table 11.) xii

proportion to Population in Counties for each of the Years 1855–66. (Table 12.) xiii

proportional Number of Births in each Quarter to 1,000 Births in the average Quarter, 1838–66. (Table 13.) xiv

registered in England in each Quarter of the Years 1838–66. (Table 14.) xiv

proportion to Population in England in each Quarter of the Years 1838–66. (Table 22.) xxii

registered in each of the Divisions, Counties, Districts, and Sub-districts in 1866 28–82

excess over Deaths in each of the Divisions, Counties, Districts, and Sub-districts in 1866 28–82

registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1866 . . . 86–89

of Children born out of Wedlock registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1866 90–93

in quarter ending March 1866 xxxiv

in quarter ending June „ xlii

in quarter ending September „ lii

in quarter ending December „ lvii

BIRTH-RATE in Counties in each of the Years 1856–66. (Table 12.) . xiii

in England in each Quarter of the Years 1838–66. (Table 22.) . xxii

BLUE MIST noticed by Mr. Glaisher liv

BURNS AND SCALDS; Deaths from 178

Deaths and Mortality at different Ages, in the Years 1848–66. (Table 22.—App.) 197

CAUSES of DEATH of Males and Females in England, at different Periods of Life, in 1866 120–125

(Supplementary Table) of Males and Females in England at different Periods of Life, in 1866 126–129

of Males and Females in London at different Periods of Life, in 1866 130–135

of Males and Females in England, and in each of the Divisions and Counties, in 1866 136–159

(from certain zymotic and other Causes) in 1866, in the Divisions, Counties, and Districts of England 160–171

Dr. Farr's Letter to the Registrar General thereon . . . 175

unspecified 175

registered in England in each of the Ten Years 1857–66. (Table 11.—App.) 184–186

Mortality from the several Causes in each of the Years 1850–66. (Table 12.) 187–189

CAUSES of DEATH—*continued.*	PAGE
proportional Numbers dying from each Cause in 1866. (Table 13. —App.)	190
Mean Annual Rate of Mortality from different Causes during three periods of Five Years, and in 1866. (Table 14.—App.)	191–192
in England, in 1866, arranged in the order of Mortality. (Table 15. —App.)	193
CHILDBIRTH; Deaths in 1866, at different Ages, of Women after Childbearing, classed under different Diseases, and neither referred to Childbirth nor to Metria in the Abstracts. (Table 16.—App.)	194
Deaths of Women in 1866 who were returned, as pregnant, classed under certain Diseases. (Table 17.)	194
Deaths of Women from Metria and Childbirth in the 20 Years, 1847–66, and proportional Deaths of Mothers to Children born alive. (Table 18.—App.)	195
CHOLERA established itself in England in July	lv
in London in September and December Quarters	lv–lviii
Epidemic only assumed an aggravated form where sanitary defences were weak	lv
Energetic precautionary measures taken in Liverpool and Birkenhead, and Mortality in those Places	lv–lvi
Five Cholera fields	lvi
Epidemic most fatal on sea coast in the chief ports	lvi
Chester (Great Boughton) Water-supply and Cholera	lviii
Towns and colliery villages of Durham and Wales suffered severely	lviii
Wolverhampton, comparative freedom from Cholera in 1866	lix
CONSTITUTIONAL DISEASES; the number varies little from year to year	176
decrease of mortality from phthisis	176
CORONERS, Letter to	198
Defects of Coroner's informations	198
Increase of Accidental Deaths; causes thereof	198
Analysis of Violent Deaths in 1865	199
Desirability of a searching inquiry into the causes of violent and sudden deaths, and of a complete record of facts	199
Suggestion for registering fuller particulars as to "unknown" bodies found dead	200
Extracts from Acts of Parliament relating to duties of Coroners	201
Sudden Deaths; examples of complete returns	202
Violent Deaths; examples of imperfect and of good returns	202–204
CYNANCHE MALIGNA and DIPHTHERIA; Deaths in England at different Ages in each of the 12 Years, 1855–66. (Tables 2. and 3.—App.)	180
DEATHS registered in England in each Year, 1838–1866. (Table 1.)	i
proportion to Population in each Year, 1838–66. (Table 2.)	ii
in 1866.	xvi
registered in England in each Quarter of the Years, 1838–66. (Table 14.)	xiv
proportion to Population	xvii
Meteorology and Mortality	xvii
in the four Seasons	xvii–xix
of the two Sexes	xix
Mortality in Counties and in Urban and Rural Districts	xx
Mortality at different Ages of Males and Females	xxi–xxii

DEATHS—*continued.* PAGE

proportional Number in each Quarter to 1,000 Deaths in the average Quarter, 1838–66. (Table 21.) xxi

registered in each of the Divisions, Counties, Districts, and Sub-districts in 1866 28–82

in 1866 in the principal Public Institutions in London . . . 83–84

registered in each of the Four Quarters of 1866 (distinguishing Males and Females), in Divisions and Counties 94–97

of Males and Females at different Ages registered in 1866 in Divisions, Counties, and Districts 98–119

DEATHS FROM DIFFERENT CAUSES. (*See* CAUSES OF DEATH.)

DEATHS and STATE of the PUBLIC HEALTH in quarter ending March 1866. xxxvi

in quarter ending June „ . xliii

in quarter ending September „ . liv

in quarter ending December „ . lviii

DEATH-RATE of Males and Females in each of the Years 1838–66. (Table 15.) xv

in Counties in each of the Years 1856–66. (Table 16.) . . xvi

in each Quarter of the Years 1838–66. (Table 22.) . . . xxii

See also MORTALITY RATE.

DEVELOPMENTAL DISEASES; chiefly fatal in infancy and old age . . 177

Malformations 177

DIPHTHERIA and CYNANCHE MALIGNA; Deaths in England at different Ages in each of the 12 Years 1855–66. (Tables 2. and 3.—App.) . 180

DISEASES (*See* CAUSES OF DEATH).

DISTRICTS: changes in the constitution of, during 1865 172

Alphabetical Index of Districts and Sub-districts 205–218

DIVISIONS of England: Average Annual Rate of Mortality in the 11 Divisions in the 10 Years, 1851–60, and in the Four Quarters of 1866. (Table 47.) liv

EMIGRATION in 1866 ii

from the United Kingdom, in each of the Years 1815 to 1866 (Table 54.) lxvi

from the United Kingdom in 1866, distinguishing the Destination, Sex, Age, Condition, Occupation, and Origin of the Emigrants (Tables 55–56.) . . . . . lxvii–lxviii

ENGLAND AND WALES; Summary of results of Registration—

in Year 1866 ii

in quarter ending March 1866 . . . xxxiv

in quarter ending June „ . . . xli

in quarter ending September „ . . . lii

in quarter ending December „ . . . lvi

Estimated Population of both Sexes in the middle of each of the Years 1801–1868 (*excluding Army, Navy, and Merchant Seamen Abroad*). (Table 59.) lxx

ENTHETIC DISEASES growing more fatal 176

ERYSIPELAS: Deaths at different Ages in England in the Years 1862–66. (Table 10.—App.) 183

FARR, WILLIAM, M.D.; Letter to the Registrar-General on the Causes of Death 175

PAGE

FEVER ; Continued Fevers in their three forms may ultimately be distinguished when the College of Surgeons' nomenclature is circulated 175

Typhoid Fever (*Typhia*) probably sustained by increasing contamination of water, and Typhus by increasing density of population 176

Ages of the Persons who died from Fever (Typhus, Typhia, and Typhinia) in the Year 1866. (Table 6.—App.) . . . 182

Deaths in England at different Ages from Fever, in the 19 Years, 1848-66 ; and Annual Rate of Mortality. (Table 7.—App.) . 182

Annual Number of Estimated Cases, and of Deaths at different Ages, in the 19 Years, 1848–66. (Table 8.—App.) . . . 182

Deaths registered, Mortality, and Proportional Number to 1,000 Deaths in each of the 17 Years, 1850–66. (Table 9.—App.) . 183

FOREIGN STATES ; Number and Proportion to Population of Marriages, Births, and Deaths in France, Austria, Italy, and Spain . . xxiii

FRANCE ; Estimated Population in middle of the Years 1853–66. (Table 26.) xxiv

Number, and Proportion per cent. to Population, of Marriages, Births, and Deaths, in each of the Years 1853–66. (Table 27.) . xxv

Comparison of Marriage, Birth, and Death Rates . . . . xxiii–xxvi

GREAT BRITAIN ; Area, Estimated Population, Marriages, Births, and Deaths in 1866. (Table 23.) xxiii

Proportion per cent. of Marriages, Births, and Deaths to Population in 1866. (Table 24.) xxiii

HEALTH ; State of the Public Health in quarter ending March 1866 . xxxvi

in quarter ending June „ . xliii

in quarter ending September „ . liv

in quarter ending December „ . lviii

HYDROPHOBIA ; increase of Deaths 176

ILLEGITIMATE BIRTHS xiii

registered in each of the Divisions, Counties, Districts, and Sub-districts in 1866 28–82

registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1866 . . . 90–93

(*See also* BIRTHS.)

INSTITUTIONS ; Deaths in 1866 in the principal Public Institutions of London 83–84

IRELAND ; Area, Population, Marriages, Births, and Deaths in 1866. (Table 23.) xxiii

Proportion per cent. of Marriages, Births, and Deaths to the Population in 1866. (Table 24.) xxiii

Estimated Population of both Sexes in the middle of each of the Years 1801–1868 (*excluding Army, Navy, and Merchant Seamen Abroad*). (Table 59.) lxxi

ISLANDS in BRITISH SEAS ; Area, Population, Births, and Deaths. (Table 25.) xxiv

ITALY ; Population, Number, and Proportion per cent. to Population, of Marriages, Births, and Deaths, in each of the Years 1862–66. (Table 28.) xxvi

Comparison of Birth and Death Rates xxvi

LEGITIMATE BIRTHS. (*See* BIRTHS.)

LIGHTNING ; Deaths in different Districts in each of the 4 Years, 1863–66. (Table 23.—App.) 197

PAGE

LIVERPOOL; excessive Mortality in March quarter 1866 xxxvi

LOCAL DISEASES; number and distribution under the several Orders . . 176

Apoplexy and Paralysis; remarkable equality maintained in number of deaths 176

Respiratory diseases; progressive increase in mortality . . 176

necessity for diminishing the smoke of towns 177

Nephria 177

Recent great progress of surgery evident from the registers . . 177

Hernia 177

Stone less fatal since the introduction of lithotomy . . . 177

Ovarian dropsy less fatal since ovariotomy has been skilfully practised; proportion of recoveries after operation . . 177

LONDON; Health of, in 1866 lx

Increase of Population within and without the registration limits . lx

Day Census of the City lx

Births, Deaths, and Rate of Mortality, 1853–66. (Table 48.) . lx

Government of the City lxi

Jurisdiction of the Metropolitan Board of Works; rateable value of property lxi

Deaths in Public Institutions, 1855–66. (Table 49.) . . . lxi

Main Drainage; extent, cost, and amount of sewage intercepted . lxii

Deaths and Meteorology, 1849–66. (Table 50.) lxii

Deaths in 1866 in the principal Public Institutions . . . 83–84

Causes of Death of Males and Females at different Periods of Life in 1866 130–135

Annual Rate of Mortality in each of the years 1840–66 in five groups of districts. (Table 52.) lxiv

MANCHESTER; Reports on the causes of the Vitiation of its Atmosphere by Mr. John Leigh . . . . . xxxvii–xlv

MARINE REGISTER BOOK; Number of Entries in 1866 xxxii

MARRIAGES registered in England in each Year, 1838–66. (Table 1.) . i

proportion to Population in each Year, 1838–66. (Table 2.) . ii

in 1866. ii

according to different Rites and Forms iii

registered in England in each Year, 1841 to 1866, in Established Church and amongst Nonconformists; showing also the Condition of Persons married. (Table 3.) iii

in England in each Year, 1841–1866. Proportions by Licence and Banns; Proportions of Persons married who live in Houses under and over £20 in value; price of wheat per quarter. (Table 4.) iv

in England in each Year, 1841–1866; proportion of Minors; of those who signed with Marks; of Widowers and Widows. (Table 5.) vi

Buildings registered for in 1866 v

Re-marriages v

of Minors v

Signature of Marriage Registers in England, Scotland, Ireland, and France . . . . . vi–viii

in Counties of England in 1866; proportion of Marriages to population; of those who signed in Writing, of Minors, and of Re-marriages, to Total Marriages. (Table 6.) . . . vii

in England; Number and Annual rate per cent. in each Quarter of the years 1838–66. (Table 7.) viii

MARRIAGES—*continued.* PAGE

Number of Buildings registered for the solemnization of Marriages in the Divisions and Counties of England, and on the Register, on 31st December 1866. (Table 8.) ix

in quarter ending March 1866 xxxiv

in quarter ending June „ xli

in quarter ending September „ lii

in quarter ending December „ lvi

Registered in England in each of the Divisions, Counties, and Districts in 1866; distinguishing the form of Marriage and whether according or *not* according to the Rites of the Established Church; and distinguishing also the seasons of Marriage, and the Marriages of Persons according to their conjugal Condition, Minority, and Signature of the Register by marks . 2–25

Ages of 249,226 Persons married in 1866, distinguishing Bachelors, Spinsters, Widowers, Widows 26–27

Registered in each of the Divisions, Counties, and Districts in 1866 . 28–82

MERCHANT SEAMEN AT SEA; Mortality in each of the Years 1852–66. (Table 40.) xxxi

Causes of death in 1866 xxxi

METEOROLOGY of quarter ending March 1866 xxxv

of quarter ending June „ xlii

of quarter ending September „ liii

of quarter ending December „ lvii

of different parts of the Country in the year 1866. By James Glaisher, Esq., F.R.S. (Tables 44 & 45.) . . . . . xlviii–li

of Greenwich 1849–66. (Table 46.) . . . . . lii–liii

METRIA. (*See* CHILDBIRTH.)

METROPOLITAN BOARD OF WORKS; Jurisdiction of, and rateable value of Property within its limits lxi

MINORS, marriages of v

(*See also* MARRIAGES.)

MORTALITY; Annual Rate of Males and Females in each of the years 1838–66. (Table 15.) xv

Annual Rate in Counties in each of the years 1856–66. (Table 16.) xvi

per cent. at different Ages of Males and Females in England in each of the years 1838–66. (Tables 17, 18, 19, 20.) . . . xvii–xx

REPORT

TO

The Right Honourable HENRY AUSTIN BRUCE, M.P., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

General Register Office, Somerset House,
31st March 1869.

SIR,

I HAVE the honour to submit to you my Annual Report for the year 1867.

The population is estimated to have reached 21,429,508 in the middle of the year 1867, being an increase of 219,488 over that of the previous year; 10,365,688 of the total number living are males and 11,063,820 are females.

The natural increase of population as represented by the excess of births over deaths is 297,276 or 814 per day, a number much above the average. 195,953 emigrants left the shores of the United Kingdom at the rate of 537 daily; of these 57,866 were of English origin, 13,317 of Scotch,

TABLE 1.—Estimated **Population**, with the Number of **Marriages**, **Births**, and **Deaths** registered in **England**, in each **Year** from **1838** to **1867**.

1862	20,336,467	164,030	328,060	712,684	436,566	276,118
1863	20,554,137	173,510	347,020	727,417	473,837	253,580
1864	20,772,308	180,387	360,774	740,275	495,531	244,744
1865	20,990,946	185,474	370,948	748,069	490,909	257,160
1866	21,210,020	187,776	375,552	753,870	500,689	253,181
1867	21,429,508	179,154	358,308	768,349	471,073	297,276

* The Population of each of the years since 1851 is deduced from the ascertained rate of increase observed in the twenty years, 1841-61; and an allowance is made for the decrease in the rate during the latter ten years. On another hypothesis the numbers would differ slightly from the estimate here given, but as the rates of births, deaths, and marriages have been calculated on these numbers it is not considered advisable to give any other estimate of Population.

92,204 of Irish, 32,566 were foreigners: 7,778 persons whose birth-places were not distinguished are proportionally distributed in this statement.

The United States attracted 159,275 of the emigrants, while 15,503 went to the British North American colonies, the unusually small number of 14,466 to the Australian colonies, and 6,709 to various other places; the total shows a large reduction on the numbers emigrating in the four preceding years. Details showing the occupations, sex, and ages of the emigrants are given in tables at pages lix–lxi.

Emigration is considerably promoted by the sums annually remitted by residents in North America, either in the form of prepaid passage orders or in cash, to their friends in the United Kingdom. In the year 1867 the amount thus remitted was 543,029*l.*; this return is necessarily imperfect, and was obtained by the Emigration Commissioners through the courtesy of bankers, merchants, and shipowners through whom the remittances are made.

The number of persons married in England and Wales was 358,308; 768,349 children were born alive and registered; 471,073 persons died during the year; and the national registers have thus received an addition of one million five hundred and ninety-seven thousand seven hundred and thirty names, raising the aggregate number since the commencement of registration in 1837 to *forty millions four hundred and thirty-one thousand four hundred and eighty-two.*

The meteorology of the year presents some remarkable features which are described in the summary of the quarterly reports, pp. xxxiv–lii; the mean temperature of the air was 48°·6, or 0°·6 below the average; 28·4 inches of rain fell, being 4·2 inches above the average.

The price of wheat continued to rise; it was 60*s.* 7*d.* per quarter in the first three months, 63*s.* 11*d.* in the next three months, 65*s.* 4*d.* in the three following months, and 67*s.* 11*d.* in the last quarter, the average price during the year being 64*s.* 5*d.* per quarter, compared with 49*s.* 11*d.*

NOTE.—The Table may be read thus:—In the year 1838 to every 100,000 persons living there were 771 marriages or 1542 persons married, 3029 births, 2238 deaths; the number of persons living to every marriage, persons married, birth or death, was 130, 65, 33, and 45 respectively. A correction for increase of population has been made in calculating the above results; no correction, however, has been made for leap years.

during the previous year. The wholesale price of potatoes rose from 89*s.* 6*d.* per ton in 1866 to 138*s.* per ton in 1867. The returns of pauperism show a considerable increase, and the average numbers on the last day of each week amounted to 139,565 in-door and 782,390 out-door recipients of relief against 129,914 in-door and 736,839 out-door poor in the previous year.

* In the case of mixed marriages between Protestants and Roman Catholics some couples are married twice, and are counted twice in the Registers.

Marriages.

The number of marriages during the year was 179,154; of these 138,930, or 77·5 per cent., were solemnized according to the rites of the Established Church, and 40,224, or 22·5 per cent., *not* according to the rites of the Established Church. 19,395 marriages were by licence, 112,533 after banns, and 3,981 on superintendent registrar's certificate, while in 3004 instances the clergy omitted to state under which head the marriage should be recorded. 7918 marriages took place in Roman Catholic chapels, and 16,865 in the registered places of other Christian denominations, and 15,058 in the offices of Superintendent Registrars. There were 68 marriages among Quakers and 315 among Jews, both showing an increase on the preceding year.

Compared with 1866 there is a decline in the marriage rate to the extent of one person married in every 1000 of the population, the proportions being 17·70 per 1000 in 1866 and 16·72 in 1867, the diminished tendency to marry thus reflecting the continued and severe commercial depression, which commenced in 1866, combined with the increased cost of the chief articles of food.

Of the bachelors who married 145,570 were united to spinsters and 7917 to widows, while 16,304 widowers contracted marriage with spinsters and 9363 allied themselves to widows.

33 persons, 22 men and 11 women, were married after having been previously divorced; 21 of the divorced men married spinsters and one divorced man married a widow, 6 divorced women were married to bachelors and 5 divorced women were married to widowers; these numbers show an increase over the previous year, when 23 divorced persons were married.

Buildings registered for Marriages.—Of the 5780 buildings for the solemnization of marriages, which were on the register at the end of the year 1867, 1710 belonged to Independents, 1188 to Baptists, 1400 to the various orders of Wesleyan Methodists, of which 824 were of the original connection; 639 belonged to Roman Catholics, 290 to Calvinistic Methodists, and 173 to Presbyterians.

Table 4.—To every 1,000 **unmarried Males** living, and every 1,000 **unmarried Females** living, in **England** and **Wales**, the proportion who **married** at **each Age** in the **Year 1867.**

Note.—The Table may be read thus:—To 1,000 unmarried men living in England and Wales at the age 25 and under 30 years, 147·63 married in the year 1867; and to 1,000 unmarried women living at the same age—25 and under 30 years—100·91 married in the year 1867, and so on for other ages. The persons marrying without stating their ages have been distributed proportionally over all the ages in the Table.

Exclusive of churches 16,545 places of meeting for public worship in England and Wales were on the register on 31st December 1867; it is an increase of 566 during the year.

Re-marriages.—The number of widowers and widows who married was 25,667 and 17,280 respectively.

Marriages of Minors.—Of persons under the age of 21 years who contracted marriage during the year 12,299 were men and 36,144 were women. Thus in every 100 alliances 6·87 males and 20·17 females were legally infants at the time of marriage. These proportions reach a maximum in Bedfordshire, where 15 males and 27 females in every 100 were under age when married; Staffordshire, Leicestershire, Buckinghamshire, Hertfordshire, Northamptonshire, and Nottinghamshire furnish the next high proportions.

Ages of Persons married.—The total number of marriages solemnized in the year 1867 was 179,154, and the precise ages of both parties were returned in 119,173 instances. In the other 59,981 cases the column of the register in which the age should be recorded is filled in by the officiating minister or registrar of marriages with the words "of full age," "minor," "under age," as the case may be, thus losing the additional means of identification afforded by a precise statement of the age of persons at the time of marriage. The ages of the husbands in combination with the ages of their wives are shown in a series of tables which will be studied with interest. (pp. 26 and 27.)

Ten men aged 80 and under 85 were married, two of them to women between the ages 25 and 30, four to women between the ages 35 and 60, and four of the brides were aged 65 and upwards.

The mean age of the persons who married in 1867, including those re-marrying, was 28·0 years for the men and 25·8 years for the women. Excluding the widowers and widows the mean age of those contracting marriage for the first time was 25·8 years for the bachelors and 24·5 for the spinsters who married in the year.

* The proportion of Widowers and Widows in the Year 1841 is for the September and December quarters only.

Of every 1000 unmarried men of the ages 20 and under 25 living in 1867, there were 118·6 who married during the year; of 1000 unmarried women of the same ages living 134·8 became wives; in the next quinquennial period of age (25–30) 147·6 per 1000 unmarried men and 100·9 unmarried women contracted marriage in the year; in each succeeding

	XI.—MONMOUTHSHIRE AND WALES.							
42	Monmouthshire - - - -	16·60	63·1	57·1	7·35	23·93	13·23	11·46
43	South Wales - - - - -	15·80	69·1	51·9	6·71	17·95	14·44	9·32
44	North Wales - - - - -	14·10	68·4	57·6	4·39	12·39	15·14	9·71

The Table may be read thus by omitting the decimal points:—In England, among every 100,000 persons living 1,672 persons were married; of 1,000 men married 789, of 1,000 women 712, signed the marriage register by writing their names; of 10,000 men married 687 were not of full age, of 10,000 women married 2017 were not of full age; of 10,000 men married 1433 were Widowers, of the same number of women married 965 were Widows.

quinquennial age the proportions decrease more rapidly in the case of females; at the ages 30–35 the numbers were 109·8 per 1000 males and 60·8 females, at ages 35–40 there were 81·0 males and 42·2 females, at ages 40–45 there were 63·8 males and 31·3 females. The probability of unmarried women of these last ages marrying during the year is about half that of the unmarried men. At the quinquennial periods of age after 45 the proportion per 1000 of bachelors who became husbands decreased as follows: 43·1, 31·9, 23·0, 16·5, 9·2, 5·1; and 1·7 at the advanced ages 75 and under 80. The chances of the spinsters becoming wives during the year diminished more rapidly at the same periods of age, the proportions per 1000 being respectively 22·5, 12·4, 6·9, 4·0, 1·0, ·4, and ·1 at the extreme ages 75 and under 80.

Signature of Marriage Registers.—37,879, or 21·1 per cent., of the men and 51,606, or 28·8 per cent., of the women who married during the year 1867 signed the marriage register with marks. These proportions show that a continuous though slow progress in elementary education is made, and they furnish a favourable contrast with educational acquirement 21 years ago, when 32·6 per cent. of the men and 48·2 of the women who married were unable to write their names. As might be expected, London shows the highest proportion of those able to attach their signature to the register of marriage, 90·7 men and 85·5 women in every 100 having signed their names. In Westmorland the proportions were respectively 89·1 and 85·2, in Surrey 84·0 and 88·4, in Middlesex 84·1 and 86·3, in Northumberland 84·3 and 74·4, and in Hampshire, where the brides and bridegrooms wrote their names in exactly equal proportions, 83·8 per cent. The lowest amount of education as tested by signatures presents itself in Staffordshire, where only 64·8 in 100 males, and 55·3 in 100 females who married were able to sign their names; in Monmouthshire only 63·1 per cent. of males and 57·1 of females; in Bedfordshire the proportions were

and 73·1, and in Herefordshire 68·8 per cent. of men and 75·1 per cent. of women. The respective proportions of males and females who sign the marriage register vary considerably in different counties. Thus in Lancashire, where, of men, 76·8 per cent. wrote their names, only 56·0 women were able to sign otherwise than by a cross. In Oxfordshire, however, the brides excelled the bridegrooms, for while 77·0 per cent. of the latter wrote their names the former wrote them in the proportion of 80·5 per cent. In Cambridgeshire and several other counties the females also signed the register in greater proportion than the males.

Excepting London, Surrey, Middlesex, and Westmorland, no county in England reached the educational standard implied by the numbers writing their names in the marriage registers of Scotland, where 88·8 per cent. men and 78·0 per cent. women signed by writing in 1867.

As marriage is contracted on an average at the age of 27, the returns show the state of education among the marrying men and women of the country; and it is evident that the schools now existing will produce no effect whatever on the great mass of the youthful population above the school age, who will in the next 12 years become the fathers and mothers of the following generations. We shall endure all the evil consequences of their ignorance. They form an immense mass of the existing population. The number of men and women of the ages 15 and under 27, amounts to about 4,731,388; and allowing for their possible superiority over those who married in the last year, at least *a million* of them are not able to write their names. The number who do not write, estimated by the standard of 1867, is 1,182,849. When we consider that many who write their names can scarcely read, and know little of the elements of arithmetic, to say nothing of any other learning, it becomes a question whether the country ought not to make a strenuous effort to educate this great mass of the youthful adult population. A generation would thus be partially saved.

No existing school system provides for the instruction of adults; and they could not be taught as children; but many plans have been partially tried, and by careful adjustment might no doubt be rendered successful. The soldiers and sailors might all be taught to read and write; so may the artisans of the country. The agricultural labourer too might in some way be taught.

Births.

The births of living children have never been so numerous in any previous year; the number registered was 768,349; 392,224 were males and 376,125 were females. There were 35·85 births to every 1000 persons, or one birth to every 28 persons, living in 1867. The average since the commencement of registration is 33·64 per 1000, or one in every 30 persons living.

TABLE **10.** — **Number** and **Proportion** of **Male** and **Female Children** born **in** and **out** of **Wedlock** in the several **Counties** of **England** during the **Year 1867.**

Sex.—The relative proportion of births of males and females in England is remarkably constant, although it varies in different counties; the proportion of males born alive to every 100 females is never less than 104, and very rarely reaches 105. In 1867 the proportion was 104·3, exactly the same as in the previous year, while the average of the last 10 years is 104·4.

In Buckinghamshire the proportion of males born in 1867 was as high as 110·3 to every 100 females born, the average, however, during 10 years having not exceeded 103·5. In Cumberland 109·1 males were born in 1867 to every 100 females, the average being 105·1; in Northampton the proportion was 107·9 males in 1867, the average being 106; in Hampshire and Berkshire there were 107·5 male births to every 100

Mean Annual Rate per 1,000 in each Quarter					35·28	35·01	32·31	32·02

males were fewer than those of females, the respective proportions in each of these counties being 98·8, 99·5, 99·6, 99·3, and 99·9 males born to every 100 females born in 1867.

In conformity with mathematical theory the least variation in the results year by year is shown in those counties which contribute the greatest number of facts, and the proportions given in Table 11 should be examined in connexion with the columns showing the average annual number of births registered in each county.

In England the proportion of males born is lower than in the other parts of the Kingdom. In the year 1867 there were in Scotland 105·5, and in Ireland 106·4 males born to every 100 females born. In France, on an average of 44 years, 106 males were born to 100 females.

Seasons.—Winter is the season most prolific in births. They are usually most numerous in the quarter ending 31st March, and they then decrease in numbers during each succeeding quarter of the year. In 1867, however, a departure from the ordinary rule is observed, as the births were most numerous in the spring quarter, ending 30th June. The numbers registered in the quarterly periods were 194,763, 199,660, 190,782, and 183,144 respectively.

Taking 1000 as a quarterly unit of comparison, there were registered in the first three months of the year 1028 births, in the second quarter 1041, in the third quarter 985, and in the last three months the minimum number of 946 births.

Children born out of wedlock.—The births of 45,186 children born out of wedlock were registered in 1867; of these 23,218 were of males, and 21,968 of females. In every 1000 births registered in England, 59 were

1867	23·40	20·65	106	113
Average of 30 years, 1838–67	23·33	21·51	104	108

The Table may be read thus:—In the year 1838 to every 1000 males living there were 23·42 deaths of males; to every 1000 females living there were 21·46 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males* and *females;* and that out of equal *numbers living* the deaths of males were 109 to every 100 deaths of females in 1838.

illegitimate, a proportion which it is gratifying to observe is the lowest recorded since the commencement of registration. In the previous year there were 60 illegitimate births in every 1000; in 1865 there were 62, in 1864 there were 64, and in 1863 there were 65 in every 1000 births, so that a gradual improvement is perceptible year by year. The average proportions for the whole kingdom are largely exceeded in several counties; thus in Westmorland as many as 113 in 1000 children are born out

of wedlock, in Cumberland 111, in Norfolk 100, in Shropshire 94, in the North Riding of Yorkshire 90, in Herefordshire 88, in Nottinghamshire 80, in North Wales 79, and in Lincolnshire 78 in every 1000 births. The counties having the lowest rate in 1867, were Middlesex (extra-metropolitan) 39, London and the extra-metropolitan parts of Surrey each 41, Monmouthshire 47, Kent 49, and Hampshire 50 per 1000 births.

Deaths.

In a population of 21,429,508, as estimated for the middle of the year 1867, the number of persons who died in that year, exclusive of still-born children, was 471,073. This sum of mortality was less than the amount in any previous year since 1862, and it was considerably less than that of the cholera year 1866, when the deaths rose to more than half a million. In thirty years six millions have been added to the English population, and the deaths in 1867 were more numerous than they had been in 1838 by about 130,000.

The rate of mortality was 21·98 per 1000 of the estimated population against an average annual rate of 22·55 in the ten years 1857–66; or it may be stated that the number of persons living to one who died was in the proportion of 45·5 in 1867, whereas in the preceding ten years the average annual proportion of the living was 44·3.

The extreme rates of mortality experienced in the course of thirty years occurred in 1856, when the result was as low as 20·51, and in 1849, when, under the pressure of a fierce cholera epidemic, the death-rate rose to 25·12 per 1000.

The Seasons.—The temperature of the air in its fluctuations from low to high and high to low, now steady or moderate, now fickle or extreme, produces effects on human health and sickness, which, if not more certain and striking than those caused by some other physical agents, are most of

* For mode of reading this Table, see Note to Table 18.

Note.—The Population used in the above calculations is now deduced from the ascertained rate of increase observed in the 20 Years 1841–61.

all the subject of daily and hourly observation. The year 1867 cannot be described as generally in its course a period of warmth. June and July were cold months; the weather was changeful, with much cloud and little sunshine, and in the latter month the rain was greatly in excess. In each of the first three quarters, according to the observations at Greenwich, the mean temperature of the air did not exceed or hardly exceeded its average, and in the last quarter it fell decidedly below the standard. Eleven inches of rain fell in the third or summer quarter, an amount which is 4 inches in excess for the same period.

In the winter quarter (ending 31st March) the deaths were 134,008, in the next 112,355, in the third 108,513, and in the fourth or autumn quarter 116,197. These numbers imply the following death-rates successively, 25·5 per 1000, 21·1, 20·1, and 21·4. Out of 1000 deaths in the whole year the proportional numbers are for the first quarter 284, for the second 239, for the third and fourth quarters respectively 230 and 247. The rate of mortality in the winter and the average for the winter season were almost identical, the mean temperature at Greenwich having been

The Table may be read thus:—Of 1000 males living of the age 35 and under 45, 13·58 died in 1838, 12·65 in 1839, and 11·62 in 1850; the average annual rate in the 30 years, 1838-67, among the aggregate of males in this decennial period of age was 13·03.

38·9°, which is also near its average, although on three nights in the first week of January the thermometer fell to 6·6°, 7·7°, and 10·4°. In the spring the rate of mortality was below the average, the mean temperature of the period (53·5°) having been slightly in excess of its average value. In the summer mortality there was a close approximation to the average, the mean temperature having been 59·7°, and almost exactly corresponding with the average. And the mortality of autumn was under the average, although the air was cold, the mean temperature having been 42·5°, which is 2·1° below the average. The mean temperature of 1867 was 48·6°, a general result which indicates nothing unusual as regards climatic condition.

But any investigation of the laws of health and sickness, life and death, in connexion with meteorological phenomena, which is confined in its scope to *mean* temperatures, must be imperfect, and can hardly be expected to be crowned with any important results. The facts observed were entities; they had an actual existence, and they produced actual effects; but the mean forces derived from them exist only in the tables of the meteorologist. Two periods of equal length might be compared as regards the mean force of the wind, and two amounts might be obtained exactly equal. One of those periods, though generally marked by tranquillity of the air, might in one or two short intervals have given birth to hurricanes, and in this latter mood the noblest trees may have been uprooted, the ocean strewed with wrecks, buildings overthrown, and their inhabitants buried under them. Throughout the second period the movement of the air, undisturbed by convulsions, may have sufficed only to maintain a healthy and agreeable freshness. The character of the two periods, estimated, by total work done in each, by the anemometer, would be the same; the facts on which it was based, and the effects produced by these on the face of nature, would be entirely different. The temperature, weight, humidity of the atmosphere, and other physical forces should not be masked under mean values, but laboriously traced throughout their course from day to day, and, if it were possible, from morning to night and from night to morning, and observed in connexion with the contemporaneous facts that relate to human life, as these also are successively

recorded, if the sway which they exercise is to be appreciated in its full significance.

Sex.—Of the total number of deaths, viz., 471,073, those of males were 242,588, those of females 228,485. The mortality of males was 23·40 per 1000 of males living; the mortality of females was 20·65 out of a 1000 females living. The difference of results in relation to the sexes is remarkable. The mortality of the year bore more heavily on males than it did on females, for the average mortality of the former is 23·33 per 1000, that of the latter is 21·51.

To a hundred deaths of females the proportion of deaths of males was 106; the average is 104. But in the population as constituted in England the number belonging to the female sex preponderates over the number of males. If the latter had been as numerous as the former they would have supplied 113 deaths (instead of 108, the average) for every hundred deaths that occurred in females.

To persons who are accustomed to engage in biological researches it may be proposed as a question whether there can be ascertained in the climatic constitution of 1867 any adverse elements by which the male sex can be supposed to have suffered, while females were comparatively protected from their operation.

Locality.—The death-rates in English counties exhibit a range which is of considerable width, though necessarily less than what is shown in the comparison of town and country. Herefordshire attained the highest point of salubrity in the year, and there the rate of mortality was as low as 16·50 per 1000. Surrey in its extra-metropolitan parts was next, where the rate was 16·83 per 1000. These furnish the only instances in which the rate was lower than 17·00. Rutlandshire, Huntingdonshire, and Dorsetshire produced death-rates varying from 17·65 in the first to 17·83 in the last. London and Leicestershire experienced equal mortality, namely, 23·0 per 1000. But all the highest rates occurred in the thick populations of northern counties, where children abound, and mining, manufactures, and traffic are fertile of accidents. In Durham county and the West Riding of Yorkshire the death-rate was 24·4; in Cumberland 24·78; in Northumberland 25·5; and it culminated in Lancashire, where it was 26·83. Such differences, probably, are little, if in any degree, the effect of various clime. The people scattered at the foot of the Cheviots, and doubtless those of many rural spots in Lancashire over which the smoky veil that wraps its large towns has not been drawn, are as healthy as the populations that breathe the warmer and milder air of the southern counties.

Towns.—London and Bristol, in which the death-rate was 23 per 1000, were the healthiest of 10 large towns in 1867. In Birmingham and Sheffield the mortality was above 24; in Hull 25. In Liverpool it was nearly 30; in Newcastle-on-Tyne it was nearly 31; and in Manchester it was as high as 31·4.

Death-rates at different ages.—It was remarked above that the mortality of males exceeded the average, while that of females was below it. But this statement holds good not in the early periods of life but in the more advanced, as the following results will show. From birth to five years of age the death-rate of males was 67·98 per 1000 against a mean rate derived from the returns of 30 years (1838–67) of 72·42. The death-rate

1858	112,414	1000	1134	955	865	1046
1859	110,195	1000	1118	961	938	983
1860	105,680	1000	1166	1054	812	968
1861	108,778	1000	1129	990	923	958
1862	109,142	1000	1133	986	839	1042
1863	118,460	1000	1095	999	942	964
1864	123,883	1000	1159	949	901	991
1865	122,727	1000	1159	946	916	979
1866	125,172	1000	1118	1029	924	929
1867	117,768	1000	1153	956	914	978

of females at the same age was 58·41 against 62·46. At the age of 5 years and under 10, males died at the rate of 6·60 per 1000, the mean rate being 8·79; and females at that of 6·29, the mean being 8·67. At the age 10–15 years the lowest mortality occurred; it was 4·07 in the male sex against the mean 4·95; and it was 3·91 in females against the mean 5·10. In the period 15–25 years the rate in males was 7·26, the mean 7·90; in females 7·33, the mean 8·22. In the period 25–35 years the rate in males was 10·80, the mean 9·93; in females 9·31, the mean 10·15. In the period 35–45 the rate in males was 14·34, the mean 13·03; in females 11·49, the mean 12·30. In the age 45–55 years the rate in males was 17·61, the mean 18·16; in females 16·10, the mean 15·67. In the period 55–65 years, the rate in males 31·59, the mean 31·53; in females 31·14, the mean 28·56. In the period 65–75, the rate in males 78·91, the mean 68·54; in females 51·19, the mean 57·52. In the period 75–85 the rate in males rose to 157·44, the mean 147·74; in females it was 148·42, the mean 135·36. In the period 85–95 years the rate in males was 355·38, the mean 309·22; in females 299·25, the mean 283·07. At the age 95 and upwards men died at the rate of 521·54, the mean 446·87; while among women the proportion was 442·22; the mean being 432·05. Thus of persons living at this extreme age nearly a half sunk under the load of years.

From these facts it appears that the mortality of males in all the above quinquennial or decennial stages of life was higher than that of females, except in the period 15–25 years.

TABLE **22.**—**Number** and **Annual Rate** per 1000 living of **Deaths** in **England** during each **Quarter** of the Years **1838–67.**

Mean Annual Rate per 1000 in each Quarter					25·12	22·25	20·50	21·81

* These rates may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 2,615 deaths registered. The three months January, February, March, contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

It appears further, that amongst males the mortality was under the mean in the first four stages, to wit, up to the age of 25 years, as also at the age 45–55 years, and that it was below the mean at all other stages. On the other hand, in the female sex the rate of mortality was below the average up to the age of 45 years, and afterwards, with the exception of 65–75 years, was above it, though that excess was not so great as in males, and did not countervail the decrease in the earlier periods of life in such degree as to raise the total mortality of the female sex above its average.

The number of boys who died in the year under five years of age was 101,502, out of a total number at all ages amounting to 242,588. The proportion which these numbers imply is that of 10 to 24. The number of men who died at the age of 85 and under 95 years was 4407; that of men at still more advanced ages was 212, among whom were 17 centenarians.

The number of females who died in the year under 5 years of age was 87,096, out of a total number at all ages of 228,487. These figures exhibit a proportion of 10 to 26. The number of women who died at the age 85–95 years was 5926. The number of still greater age was 438, in which number 53 centenarians are included.

Further details relating to marriages, births, and deaths that occurred in 1867, with remarks on the sanitary condition of districts, and other matters, will be found in the summary of quarterly reports that are appended to this letter, and which were published within a month after the expiration of each quarter.

The United Kingdom.

The population of the United Kingdom estimated for the middle of the year 1867 was 30,157,473, of which, besides the 21,429,508 in England and Wales, there was 3,170,769 in Scotland and 5,557,196 in Ireland. The English marriages were 179,154, the Scotch 22,521, the Irish (corrected for defect of registration) 46,459; the total number 248,134. The births were in England 768,349, in Scotland 114,115, and in Ireland 199,252 (corrected); total number 1,081,716. The deaths were 471,073 in England, 69,024 in Scotland, and in Ireland (after correction) the number was 122,161. Total number of deaths in the three divisions 662,258.

The English people married at the rate of 16·72 to 1000 of the population; the Irish probably at the same rate; the Scotch at a rate of lower activity, 14·20.

TABLE **23.**—Estimated **Population, Marriages, Births,** and **Deaths** in the **United Kingdom,** in the Year **1867.**

	Area in Statute Acres.	Estimated Population in the middle of the Year 1867.	Marriages.	Persons Married.	Births.	Deaths.
United Kingdom	77,286,901	30,157,473	248,134	496,268	1,081,716	662,258
Great Britain - -	56,964,260	24,600,277	201,675	403,350	882,464	540,097
England and Wales -	37,324,883	21,429,508	179,154	358,308	768,349	471,073
Scotland - - -	19,639,377	3,170,769	22,521	45,042	114,115	69,024
Ireland - - -	20,322,641	5,557,196	46,459	92,918	199,252	122,161

Note.—The *registered* Marriages, Births, and Deaths for Ireland were 29,796, 144,318, and 93,911 respectively. By the authority of the Registrar-General of Ireland these numbers have been corrected in the above table for defective registration. It has been assumed that the marriages, births, and deaths in Ireland in the year 1867 were in the same proportion to population as the marriages, births, and deaths in England.

Births in England occurred at the rate of 35·85 per 1000 of the population; in Ireland probably at the same rate; and in Scotland at a rate slightly higher, 35·99.

The people of England died at the rate of 21·98 per 1000; the death-rate in Ireland was probably little different. In Scotland it was 21·77.

TABLE **24.—Proportion** per **1000** of **Marriages, Births,** and **Deaths** to the Population of the **United Kingdom,** in the Year **1867.**

	Acres to a Person.	To 1000 Persons living.			
		Marriages.	Persons Married.	Births.	Deaths.
United Kingdom	2·56	8·23	16·46	35·87	21·96
Great Britain	2·32	8·20	16·40	35·87	21·95
England and Wales	1·74	8·36	16·72	35·85	21·98
Scotland	6·19	7·10	14·20	35·99	21·77
Ireland	3·66	8·36	16·72	35·85	21·98

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the "density" of the population, or the population to each acre, square mile, or other measure.

TABLE **25.—Population, Births,** and **Deaths** in the **Islands** in the **British Seas.**

1868	148,028		55,600		58,178		34,250	
	Area in Statute Acres.							
—	226,684		180,000		28,717		17,967	

Note.—The above numbers have been compiled from returns furnished to the Registrar-General by Lieutenant-Colonel J. F. Murray, Government Secretary of Jersey, Lieutenant-Colonel W. Bell, Government Secretary of Guernsey, &c., and by Mr. J. T. Clucas, Clerk to Council and Secretary to Lieutenant-Governor of the Isle of Man. The returns for Guernsey and adjacent islands are imperfect owing to certain denominations neglecting to register the births and deaths.

* The increase in the number of deaths in each of the years 1864–66 is attributable to the prevalence of fever and small-pox. The Island is visited by a considerable number of persons, and it is estimated that on 1st August 1867 there were 64,000 persons on it.

† The decrease of population in 1867 is confined to Alderney, and is attributed to the discharge of men from the Government works.

Foreign States.

In France marriages were celebrated to the number of 299,521. The proportion to the population of persons married (599,042) was 15·68 per 1000 against 16·72 in England. The French births were 1,002,621; the birth-rate 26·24 per 1000 that of England being 35·85. The French deaths were 866,366; the death-rate 22·68, while in England the mortality was 21·98 per 1000.

The population of France estimated for the middle of 1867 is 38,204,696.

The population of Italy, including Venetia, was at the same time 25,404,723. The marriages were 170,456; the births 927,396; the deaths 866,865. The proportionate results derived from these numbers are :—of persons married there were 13·44 per 1000; of births 36·51; of deaths 34·12.

The first of these results is low as compared with the English or French marriage-rate; the second is high; the third enormous.

Table 26.—**Estimated Population** of **England, France,** and of **Austria, 1853** to **1867.**

1866	21,210,020	38,067,064†	20,835,008‡
1867	21,429,508	38,204,696†	20,986,536‡

* M. Legoyt, director of the Statistical Department of France, has favoured the Registrar General with the returns of France for the years 1853–61 and for the year 1866. The population in the four years 1862–65, and in the year 1867 has been estimated by means of the average annual rate observed between the two enumerations of 1861 and 1866.

† Including the three newly annexed departments, viz., Savoie, Savoie (Haute), and Alpes-Maritimes.

‡ Dr. Ficker, chief of the Statistical Department of Austria, has favoured the Registrar General with the returns of Austria. The population returned above includes Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive. From 1863–67 inclusive the population of Hungary, Croatia, Slavonia, and Transylvania is excluded. From 1853 to 1864 the States of Italy are included; from 1865 to 1867 they are excluded. It is to be hoped that the Hungarians will no longer neglect the statistics of their country.

TABLE 27.—Number and Proportion per 1000 to Population of Marriages, Births, and Deaths in England, France, and in Austria, 1853–67.

(The returns relating to France are supplied by M. LEGOYT, Director of the Statistical Department of France. Those relating to Austria are supplied by DR. FICKER, Chief of the Statistical Department of Austria.)

* The returns for France in the years 1861 to 1866 include the three newly annexed departments. The deaths of Frenchmen abroad—civil or military—are registered in the books of the commune in which was their last domicile. M. Legoyt has revised the population and the numbers of marriages, births, and deaths for the years 1853–65.

† The returns for Austria include Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive. From 1863–67 inclusive the returns are exclusive of Hungary, Croatia, Slavonia, and Transylvania. From 1853 to 1864 the States of Italy are included; from 1865 to 1867 they are excluded. For the years 1860–62 the numbers for Hungary and its annexed territories have been estimated.

‡ In France in 1865 and 1866 cholera was prevalent.—(*M. Legoyt.*)

§ Dr. Ficker attributes the excessive mortality in the year 1866 to cholera and war.

The British Army.

His Royal Highness the General Commanding-in-Chief has favoured me with a Return which exhibits the strength and mortality of the army at home and abroad in the year now under review. At home the average strength in 1867 was 87,607 officers and men, abroad 112,728; total 200,335. In England and the Channel Islands the strength was 60,344; in Scotland 3517; in Ireland 23,746. In the total strength at home the deaths were,—of officers 49, of non-commissioned officers and men 901, representing a mortality in the former of 10·95 per 1000, and in the latter of 10·84 per 1000. In Great Britain the death-rate of officers was

* The new law which in 1866 removed civil registration from the parochial authorities to the communes, caused a marked decrease in the number of Marriages. Although the decrease is generally attributable to this cause it should be stated that a large number of Marriages were contracted in the previous year, in order to evade the law which was about to come into operation. On the other hand it should not be forgotten that in 1866 many of the Marriages continued to be celebrated at church without being registered, and are consequently not taken into account in the statistical department.

NOTE.—Dr. Maestri, writing on the 7th December 1868, adds: "Two facts are to be observed in the Tables of 1867 — "The decrease of births and the remarkable increase of deaths. The cause of the former may possibly be found in the "dearness of provisions, produced by the failure of the harvest in many states of Europe, from the effects of which Italy "also suffered by rebound of the disaster. In respect to the increase of deaths, we perceive in that fact the influence of "cholera, from which about 117,000 persons died in 1867."

TABLE **29.—Spain. Population, Numbers** and **Proportions** per 1000 of **Births** and **Deaths** in each of the Years **1861** to **1867.**

TABLE **35.** — **Annual Rate of Mortality** per 1000 amongst the OFFICERS and NON-COMMISSIONED OFFICERS and MEN in the **Army Abroad**, in each of the Years **1858–67.** (Deduced from the Strength and Deaths as given in the two preceding Tables.)

YEARS.	OFFICERS.	NON-COMMISSIONED OFFICERS and MEN.
1858	35·13	67·01
1859	21·11	33·96
1860	16·39	26·03
1861	15·74	25·67
1862	13·46	19·81
1863	15·86	16·82
1864	17·35	18·93
1865	15·76	21·02
1866	12·64	15·49
1867	13·33	20·66

in officers, and 20·66 in men. In 1865 the mortality of men abroad was 21·02; in 1866 it fell as low as 15·49 per 1000.

The deaths of the English and Welsh soldiers (officers and men) in the army abroad in 1867 may be estimated at 1298.

Births and Deaths of British Subjects at Sea.

The number of seamen reported to the Registrar-General of Seamen as having died in the merchant service in 1867 is 5283. When this is compared with the mercantile marine force, amounting to 196,340, it yields a proportionate mortality of 26·9 per 1000. The deaths from each separate

Table **36.—Army serving at Home and Abroad.**

1866	646,636	11,942	18·46
1867	615,409	4,422	7·22

disease, compiled from a return furnished by the Registrar General of Seamen, are given in page lxii.

There were 367 deaths of sailors from typhus, 214 from dysentery, 212 from cholera, 346 from yellow fever, 1808 by shipwreck, 1105 by other accidental drowning. Nearly half of the deaths of seamen occurred in the period of life 20–30 years.

Excluding seamen, soldiers, and marines, the deaths of British subjects at sea were 655. And to the same class of passengers 339 children were born.

Marine Register Book.

It is required by the Registration Act and the Passengers' Act that captains or commanding officers of British vessels should transmit to me the particulars of all births and deaths that occur at sea amongst English subjects. The entries for 1867 in the Marine Register Book which is kept by me are 114 births and 172 deaths; but the returns are far from complete.

Table 39.—Number of Births and Deaths of British* Subjects at Sea, exclusive of Soldiers, Marines, invalided Seamen from the Royal Navy, and Seamen on Ships' Articles, in the Years **1856–1867,** reported by the Captains or Commanding Officers of Vessels to the Registrar General of Seamen at the Termination of their respective Voyages in Ports of the United Kingdom.— (Furnished to the Registrar General by the Registrar General of Seamen.)

	Total	4,151	2,461	6,612

* British *subjects* are not particularly described in these returns, but foreign names have been excluded. A column headed *Place of Birth* was formerly contained in these returns, for the purpose of distinguishing passengers as British subjects or Foreigners, but in many cases it was not filled up by masters, in consequence of their inability to obtain the information after the death had taken place. British and Foreign *seamen* are distinguished.

† The deaths of soldiers, marines, and seamen from the Royal Navy, who were passengers in British Merchant Ships, were 33 in 1856, 59 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, 122 in 1862, 116 in 1863, 96 in 1864, 140 in 1865, 184 in 1866, and 97 in 1867. The number is 1,464 in twelve years, which, if added to the 6,612 above, makes 8,076, the total number of deaths of British subjects at sea in 1856–67, exclusive of those of merchant seamen.

Names on the Registers, and Searches.

The names of all persons whose marriages, births, and deaths in the 30½ years (from the middle of 1837 to the end of 1867) have been recorded in the registers amounted at the end of that period to the number of 40,431,482, of which 1,597,730 were entered in the last year of the series. Respecting facts recorded of this immense accumulated list of persons enquiries are daily made at this office with the view to procure evidence of births, deaths, or marriages.

The number of searches for registers at the Central Office continued to increase during 1867. In the indexes prepared under the Registration Act 11,306 searches were made, and 9517 certificates were given; the searches for non-parochial registers were 1030, and the certificates granted 757. The total amount received in fees for searches and certificates, and paid into the Exchequer was 1,906*l.* 16*s.* 6*d.* The numerous searches for registers of births for purposes connected with the Factory Acts, being made without charge, are not included in the above.

In addition to the 11,306 searches for registers on payment of the fee of 1*s.* each under the Registration Act, 566 registers were searched for and found upon the production of copies under the hands of clergymen or registrars, making 11,872 searches in all. Of these 4756 were for registers of births, 5293 of deaths, and 1823 of marriages.

The certificates of births are applied for in the largest proportion of cases when the individuals have recently attained the age of 21 years. Thus nearly one-third of the birth searches concerned persons who were born in the five years ended in 1846, the number for that year being more than double the average of the period. The searches for births registered in the first 10½ years of the civil registration, namely, from 1st July 1837

Table **40.—Mortality** of **Merchant Seamen at Sea,** in the 16 Years **1852-67.***

1867	196,340	5,283	26·9
In the 16 years 1852-67	2,851,933	58,462	20·5

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Seamen. This return does *not include seamen dying ashore in foreign parts*, whose wages and effects are delivered to the consuls or officers of the hospitals to which such men are sent; accounts of their effects are sent direct to the Board of Trade.

If a seaman dies on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel is not to return direct to the United Kingdom. But if a *passenger* dies on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred. In some passenger-ships women are employed as stewardesses, and are counted as part of the crew. They therefore form part of the strength in this Table, and if the death of a stewardess occurs in the course of a voyage, it is included in the column of Deaths.

When a ship is lost with all persons on board, the owners return the number and names of the crew, and the names of the passengers, when known, to the Registrar-General of Seamen.

to 31st December 1847, were 2588; for those registered in the next 10 years, 1499; and for those registered in the 10 years ended 31st December 1867, only 669. It appears, therefore, that until the age for apprenticeship is reached a certificate of birth is not often required.

The certificates of deaths are applied for in the largest proportion of instances where the individual has not been many years deceased. The searches for deaths registered in the first 10½ years of registration were 903; in the succeeding 10 years, 1476; and in the decenniad ended 31st December 1867 they were 2914, and of these 1862 concerned persons deceased in the five years 1863–67.

Of the 1823 marriage registers searched for 498 concerned parties married or supposed to have been married before the end of 1847; 516 had reference to the 10 years ended 1857, and the remaining 809 to the 10 years ended 1867. Many speculative searches are made with a view of discovering whether a marriage has taken place or not, and the proportion of unsuccessful searches for very recent *alleged* marriages is about one-fourth of the whole number searched for.

The following are the registers and records deposited in my custody at this Office for public use on payment of the statutory fees, viz., 1*s.* for search, and 2*s.* 6*d.* for certificate or certified extract:—

1. Registers of Births and Deaths registered in England and Wales on and after 1st July 1837.
2. Registers of Marriages registered in England and Wales on and after 1st July 1837, after solemnization in Churches of the Established Church, in registered Roman Catholic and Dissenting Places of Worship, and in District Register Offices; also of Quakers and of Jews.
3. Registers of Births and Deaths at Sea registered since 1st July 1837.

Note.—The numbers registered in 1837 are for the Half Year ending December 31st.

4. NON-PAROCHIAL REGISTERS OF BAPTISMS or Births, BURIALS or Deaths, and (in a few instances) of MARRIAGES, being the Registers or Records kept by various bodies and congregations of Nonconformists prior to the general system of registration commenced in 1837 ;—comprising amongst others the Registers kept at *Dr. Williams' Library* from 1742 ; *Bunhill Fields Burial Ground* from 1713 ; the registers of *French Protestant and other Foreign Churches* in England ; the registers of the *Society of Friends*, &c.
5. REGISTERS OF MARRIAGES of British Subjects in FOREIGN COUNTRIES, pursuant to the Act 12 & 13 Vict. c. 68. [The Marriages under this Act are those solemnized since July 1849, at British Consulates abroad.]
6. REGISTERS OF MARRIAGES IN INDIA, pursuant to 14 & 15 Vict. c. 40. [The Marriages under this Act are those solemnized since 1st January 1852, in the presence of Registrars in India ; the Marriages by Clergymen of the Church of England are not included.]
7. REGISTER OF BUILDINGS CERTIFIED to the Registrar General AS PLACES OF RELIGIOUS WORSHIP (18 & 19 Vict. c. 81.)
8. RETURNS OF PLACES OF WORSHIP certified to Diocesan Registrars, Clerks of the Peace, &c. prior to 1st July 1852 (19 & 20 Vict. c. 119. s. 24.)
9. FLEET and MAY FAIR REGISTERS OF MARRIAGES.
10. REGISTERS OF BIRTHS AND DEATHS of British Subjects received from Her Majesty's Consuls and from other authorities in Foreign Countries.

Numerous applications respecting registers in the British colonial possessions being made to me, I have obtained, through the courtesy of the Secretary of State for the Colonies, information as to the arrangements for registration now in force in most of the colonial possessions, and it has appeared to be desirable to give a *précis* of the particulars in this Report.

A full Report on the Causes of Death in England, addressed to me by Dr. Farr, will be found in the Appendix, and accompanying the usual abstracts are detailed tables of considerable interest relating to the violent deaths registered during each of the last five years.

I have the honour to be,
Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

Summary of the Quarterly Reports, 1867.

First Quarter.—January, February, March.

The United Kingdom.—The Registers of the United Kingdom show that the births of 260,284 children, and the deaths of 184,445 persons of both sexes, were registered in the three months ending on March 31st.

The registered marriages of the United Kingdom in the quarter ending March 31st, 1867, were 54,589.

The death-rate of the United Kingdom differs little from that prevailing in England and Wales. The several facts concerning the other divisions of the Kingdom are set forth in the reports of the Registrar General of Scotland and the Registrar General of Ireland.

The resident population of England, Scotland, and Ireland in the middle of 1867 is estimated at about 30,157,473. The corrected death-rate of the quarter is 25·5 per 1000.

England.—The returns are on the whole satisfactory. The marriages and the births are above the average numbers. The death-rate is exactly the average of the season, but it is lower than it was in any of the three previous winters. Had it not been for the intense cold weather in January, which proved fatal to many old people, and for epidemics of whooping-cough, small-pox, and measles, the results would have been still more favourable. Cholera was only epidemic in Durham, and there it has subsided. Prices are high, and the scarcity of potatoes is likely again to give rise to scurvy unless other antiscorbutics are resorted to.

Marriages.—72,882 persons were married in the three months of January, February, and March; and thus the annual marriage-rate of the season, in which it is invariably lowest, was 13·8 per 1000, the average of the three months being 14·0. The decline of marriages in Cornwall was remarkable, and the emigration from the mining districts of that county is spoken of as an exodus. Marriages in Durham and Northumberland in the Northern Division were depressed; but the marriages in the other divisions showed little variation from the average.

Births.—The number of children born in the winter quarter (Jan., Feb., Mar.) of the present year was 194,763 against 196,753 in the winter of last year. In London the births in three March quarters (1865–7) were successively 27,824, 28,410, and 28,933, showing a constant increase. In Yorkshire they were in the same times 20,740, 20,871, and 20,477, showing a decrease.

The annual birth-rate of last quarter was 37·1 per 1000 against an average of ten winter quarters of 36·6.

By comparing the birth-rates of certain large towns it is found that the highest was in Leeds, where the rate reached 43·5 per 1000. In Glasgow it was 42·6; in Sheffield 41·8; in Liverpool 41·4; in Birmingham 40·7; in Bristol 39·8; in London 38·4; in Edinburgh 36·5.

Increase of Population.—The deaths in the March quarter were 134,008, and the births, as has been stated, were 194,763. These numbers show a balance, amounting to 60,755, which represents natural increase of population.

This result is affected by the daily flow of emigrants. Of these the total number from all ports in the United Kingdom, where emigration officers are stationed, was 26,753 in the quarter ended 31st March.

Distinguishing the emigrants in respect to origin, this number consisted of about 8000 English, 1200 Scotch, 14,000 Irish, 3000 foreigners. There went to the United States nearly 7000 English, 900 Scotch, 13,000 Irish. 2000 persons of various origin went to the Australian colonies, less than 100 to British North America.

In the March quarter of the three years 1865–6–7 the total emigration was 27,513, 39,672, and 26,753.

Prices, Pauperism, and the Weather.—Wheat rose from 56*s.* 8*d.* per quarter, its price in the last three months of 1866, to 60*s.* 7*d.* in the first quarter of the present year. Beef, as sold by the carcase at Leadenhall and Newgate Markets, was from 4¾*d.* per lb. for inferior quality to 7*d.* for superior quality. The same prices have ruled for the last six months. Mutton was decidedly cheaper than it had been for some time previously. The worse and better qualities were 5*d.* and 7¼*d.* But potatoes were very dear; the best at waterside market, Southwark, having ranged from 115*s.* to 160*s.* per ton. The mean price was 137*s.* 6*d.*; that of the March quarter in last year was 72*s.* 6*d.*

Pauperism exhibits a marked increase, as is shown in the following average numbers of persons relieved on the last day of each week in three winter quarters:—

Quarter ending 31st March.	Indoor.	Outdoor.
1865	142,329	813,371
1866	139,546	759,402
1867	147,620	832,364

The month of January opened with a severe frost which continued till the 5th, and the defect of temperature was great, particularly on the 4th. The thermometer fell to zero at many places, and below that point at others. Snow fell frequently all over the country, and in such amount that traffic by road or railway was rendered difficult, and in some places was quite suspended. This severity of weather was succeeded by a sudden thaw, and by heavy gales of wind from the west and south-west. The snow was cleared away rapidly, and its sudden melting caused rivers to overflow their banks in many parts of the country. From January 6th to 10th the average excess of daily temperature above the average was 7 degrees. On the 11th another period of frost set in and continued till January 22d, during which there were several very heavy falls of snow, especially in the northern parts of the kingdom. Cases were reported of persons who perished in the snow. The average daily deficiency of temperature on those twelve days was nearly 10 degrees. On the morning of the 23d a sudden change took place; the temperature was no less than 20 degrees higher than that of the preceding day, and a period of warmth almost unprecedented for the season commenced, which lasted for thirty-five days. The average excess of temperature during this period was 7 degrees daily, and it is necessary to go back as far as 1779 for a period of higher temperature and of equally prolonged duration. The melting of the snow and heavy falls of rain produced inundations which were extensive in some parts of Yorkshire and Lincolnshire. From February 27th to the end of March the weather, except on a few days, was cold and wintry; snow and sleet were frequent all over the country. In the first three weeks of March the average daily defect of temperature at Greenwich was nearly 7 degrees. January and March will be distinguished in meteorology for their severe frosts and snow-falls, February by its high temperature, and the whole quarter by an unusual succession of heavy gales. In February the excess of rain and the floods impeded agricultural operations, while in March vegetation was checked and growing crops damaged by the protracted wintry character of the season.

At Greenwich the mean temperature of January was 34°·2; of February 44°·7; of March 37°·7; of the quarter 38°·9. The rain-fall in the three months was 6·3 inches, which is an inch and a half above the average.

Deaths; and the State of the Public Health.—The deaths in the three months that ended in March amounted to 134,008; and the annual rate of mortality was nearly 26 per 1000 for the winter, which is now in England the most fatal of the four seasons. The death-rate was 27 in the town, 23 in the country districts. In the thirteen great towns of the United Kingdom the winter death-rate was 29. Hull had the lowest rate, 25; Newcastle-on-Tyne the highest, 37. It may be desirable to inquire into the causes of the singular insalubrity of this city of the Tyne, for which nature has done so much, and for which the municipal authorities appear to be still incapable of procuring the conditions of healthy existence. If coals are dear that is scarcely a disadvantage to Newcastle, which supplies the country with that article and obtains its artificial heat at much cheaper rates than London. The dwellings, the water supply, the drainage, the scavenging, the disinfection of the sick, the habits of the people, demand effectual measures of reform; and then Newcastle, now classed among the great towns of the kingdom, will no longer be the worst hot-bed of epidemics amongst them.

In one parish of Newcastle there are seventeen unpaved streets, together with a large number of back lanes: in the cellars or underground kitchens stood seven or eight inches of water and liquid filth; the upstairs rooms were all occupied by four and five families in each house. The Registrar of Westgate, after noticing that the mortality has been very great, says that "it would have been much worse but for the strenuous exertions of the public health committee," who collected information, and instituted house-to-house visitation.

Thirty-five persons, including 22 males and 13 females, died of cholera, 19 of diarrhœa, in the sub-district of St. Nicholas, Durham; and there the epidemic had apparently subsided at the end of the quarter.

The deaths by two terrible colliery explosions appear in the returns; the one at the Oaks Colliery, where the deaths of 320 colliers were registered, while a number not exceeding 50 still remain unregistered; at Talk-o'-the-Hill Colliery, the other raised the deaths of the district up to 155, the births remaining only 83.

In the SOUTH EASTERN DIVISION the mortality was at the rate of 22 per 1000; in the SOUTH MIDLAND, 24. The deaths of Southampton have fallen from 330 to 216 on the last winter; and the mitigation of the heavy mortality hitherto prevailing in this important town is ascribed to the alteration of the drainage under the supervision of the sanitary committee. Diphtheria was fatal to seven persons in the Soham sub-district of Newmarket. Oxford has been much healthier than Cambridge during the quarter; the deaths having been 86 in the Oxford district, 184 in the Cambridge district. The Oxford workhouse is in Headington, but the mortality of the two districts together is at the annual rate of 21, while that of Cambridge is 28. No explanation is given of the ill-health of Cambridge. The health had improved in both places in the decenniad 1851–60; and it is very desirable that Cambridge should not be deprived of the hygienic improvements on which vigor as well as health depends. Since the epidemics of 1863 Cambridge instead of improving has retrograded.

The mortality of the EASTERN COUNTIES was at the rate of 22 in 1000, or one less than it was in the previous winter. Scarlatina had disappeared in South Yarmouth; and the decline in the mortality of Norwich is remarkable: in the three last winters the deaths there were 564, 575, and 436.

The mortality of the SOUTH-WESTERN COUNTIES was at the rate of 24 per 1000; precisely the same as it was in the previous winter. Emigration from Cornwall is still going on, and at Redruth unusual distress has arisen from the depressed state of mining.

Eight deaths of men belonging to a Swedish brig, and 11 deaths of men belonging to a Norwegian barque, were registered in Cornwall, and may be held with others to be some set-off against the unregistered loss of English lives on foreign strands.

The mortality in the WEST MIDLAND COUNTIES was 24 (per 1000 per annum is always understood); in the NORTH MIDLAND COUNTIES, 23; in both below the rates of the previous winter. Wolverhampton with the surrounding districts is healthier than it was; but it is still not out of danger, and yet we are told deprives itself of the services of a health officer.

In the NORTH WESTERN DIVISION, Lancashire and Cheshire, the mortality was 29; in Yorkshire 27, still high, but not so high as in the previous winter. We have a right to expect that these great and aspiring counties will no longer remain the unhealthiest communities in the United Kingdom. The authorities know what is required, and can do it.

The two Northern Counties of Durham and Northumberland are unhealthier than they ever were; and the mortality of the winter quarter of the NORTHERN DIVISION was 27. The mortality has been exceptionally high in the Morpeth district during the last three months; and the deaths were 208. All the exertions of the Board of Health are required in the area over which its jurisdiction extends; and for the future no exertions should be spared to prevent the invasion of epidemics.

WALES experienced a mortality at the rate of 24 annually to 1000 living.

Second Quarter.—April, May, June.

The United Kingdom.—The Registers of the United Kingdom show that the births of 270,092 children, and the deaths of 154,053 persons of both sexes, were registered in the three months ending on June 30th. The recorded natural increase was 116,039; the emigrants were 60,876.

The registered marriages of the United Kingdom in the quarter ending June 30th, 1867, were 56,357.

The death-rate of the United Kingdom differs little from that prevailing in England and Wales. The several facts concerning the other divisions of the Kingdom are set forth in the reports of the Registrar General of Scotland and the Registrar General of Ireland.

The resident population of England, Scotland, and Ireland in the middle of 1867 is estimated at 30,157,473. The corrected death-rate of the quarter is 21·0 per 1000; the birth-rate 37·3; the marriage-rate 15·4.

England.—The spring quarter has been in every respect genial. The births exceeded the average number of the season, and the low mortality presented a striking contrast to that prevailing in the previous spring. Sanitary work was accelerated last year by the impending epidemic of Asiatic cholera, and the fruits of the efforts then made are reaped now. The marriage-rate was below the average in the winter quarter, and reflected the prevailing depression of certain classes of industry.

Marriages.—In the quarter ending 30th June the number of persons married was 90,924, or 6,122 fewer than were married in the same period of the previous year. The returns confirm previous experience, and show that times of commercial depression and higher prices of wheat and potatoes are quickly followed by a decrease in the number of persons contracting marriage. The annual rate during the quarter was 170 to ten thousand of the population, which is 1·4 less than the average of the

season, and 13·4 less than the corresponding three months of 1866, when trade disasters and the consequent diminution of employment were commencing, but had not yet influenced the marriage returns.

The tables show that each of the eleven great divisions of England contributed more or less to the deficiency of marriages, as compared with the same quarter of 1866; in the counties the numbers exhibit fluctuations, and the following even show an increase, namely, Hants, Bucks, Northampton, Bedford, Cambridge, Norfolk, Dorset, Rutland, Lincoln, and Cheshire.

Births.—199,660 living children were registered in the months of April, May, and June. The increase of births is constant, and the excess in this quarter over the numbers of the previous spring quarter was 7233. The birth-rate of the quarter was 37·4, which is the highest rate on record. The increase of births was greatest in London and in the North-western Counties.

Increase of Population.—As the births were in number 199,660, the deaths 112,355, the natural increase of the people in the quarter was 87,305, or 959 daily.

Against this increase is to be put the loss by the emigration of 16,718 persons of English origin; 11,980 to the United States, 2028 to British North America, 2142 to the Australian Colonies, and 568 to other places. The internal movements of the population of the United Kingdom are unrecorded. The spring-emigration has been for the last five years stationary or declining.

Prices and the Weather.—Wheat rose in the three months from 60*s.* 7*d.* to 63*s.* 11*d.* a quarter, potatoes from 77*s.* 6*d.* a ton to 155*s.* The price of this important esculent was doubled, and its use was greatly diminished. Mutton fell from its extremely high price, but beef remained dear.

At Greenwich the mean temperature of the air in the shade was 53°·5 during the spring quarter; it was 1°·3 above the average of 96 years. Of every month the temperature was above the average; but the variations were so unusually great as to seriously affect plants of every kind. April was unsettled, windy, rainy, and warmer than usual. May, after the first few days, covered the earth with brilliant sunshine; the heat of summer filled the air, and vegetation shot out luxuriantly. Then came a great change; the sky grew cloudy, the weather cold, the nights frosty. The ground and the tender shoots of plants were frozen. Flowers were in blossom, the cuckoo, the swallow, and the nightingale had come, but it was winter weather. The young shoots of holly, ivy, walnut, beech, and even oak, were injured in many places. Strawberries and peas in flower were nipped; potatoes were damaged. At the end of May and in the beginning of June came warmth and rain, followed by cooler days to the end of the month. The hay crop was good, and was stacked in good condition. No signs of the potato disease were visible.

The rainfall at Greenwich was 6·3 inches, which is about half an inch above the average. The wind blew at a velocity of 17 miles an hour during April, 9¾ miles an hour during May and June.

Deaths; and the State of the Public Health.—112,355 deaths were registered during the three months of April, May, and June. The mortality was at the rate of 21·1 per 1000; the average death-rate of the quarter being 22.

The great towns of the country have executed a certain number of useful sanitary works. They are procuring better waters, providing drainage, adopting measures for the restoration of impurities as soil to the earth, by police measures regulating lodging-houses and dwellings; and now the towns appear to be realizing some of the results in the diminished mortality of the population. Sickness has declined. There is scarcely a

trace of the threatened cholera epidemic, which is still ravaging parts of Europe. Nothing in this country, perhaps, so well deserves the attention of the Sultan of Turkey and the Pacha of Egypt as the great fact that England, which was once ravaged by the plague that preys on the East, is free from that pestilence, and has now learnt how to disarm the terrible cholera of its malignancy.

The town districts in England contained eleven millions of people at the last census. Their average mortality in the last quarter was at the annual rate of 21 in 1000; in the ten corresponding quarters that preceded, the mortality was 24 in 1000. It is chiefly in the large town districts that the reduced mortality of the kingdom is observed, but in the country districts there was also a slight decline of death.

In the thirteen principal cities of the United Kingdom, containing about 6,187,764 people, the mortality was at the rate of 23 in 1000. The rates of the great cities stand thus: London 20, Bristol 21, Birmingham 20, Liverpool 26, Manchester 28, Salford 25, Sheffield 22, Leeds 25, Hull 22, Newcastle-on-Tyne 27, Edinburgh 29, Glasgow 29, Dublin 27. In health, Birmingham has had the best, Edinburgh the worst of it during the season. Even Glasgow is beat by Liverpool. In addition to her excellent water Glasgow will now get for its people the other complementary requirements of salubrity; but Manchester in these measures as in the water supply may take the lead.

London presents a striking contrast in health to its condition in the spring quarter of last year; the mortality now 20 was then at the rate of 25. To every five funerals in that quarter four only were performed in this quarter. Cholera at the close of the previous June had broken out in the region of the East London Water supply; in the last June no traces remained of its malignant type.

The South Eastern was the healthiest Division; the mortality was at the rate of 18. The Registrar of Croydon observes that the death-rate of the district was 17, of the parish 16. The preventible diseases, he says, have been at a minimum. In a few days time the town will be again in possession of a constant supply of water. The thorough ventilation of the sewers has greatly checked the appearance of fever of a low typhoid type, only one case having been registered during the quarter. This is one of the serious complications of watercloset drains; under that system every house is put into communication with every other house, so that the zymotic volatile stuff of disease has a chance of finding its way from house to house through this artificial channel, the only barrier being in the most favourable circumstances a film of a few inches of water. This system is an improvement on that of cesspools; but it deprives houses of the safeguards of isolation, the utility of which is evident to the grossest observation in such cases as the cattle plague. The chief security against the evils incidental to this system is to be sought in an abundant supply of water, with a fall sufficient to carry off the refuse beyond the limits of the towns where it is still liable to infect the rivers, or to surcharge the air with impurities.

The earth is one of the best known disinfectants; and in the dry state it has some of those physical properties of water, which led to the invention now so common. To a scientific clergyman of the Church of England it is due that by mechanical adaptions the earth-closet system has been constructed, which promises to be as useful in the departments of public health and national agriculture as the Reverend Edward Cartwright's invention is in the cotton manufacture. The Reverend Henry Moule, M.A., vicar of Fordington, has shown how, in the easiest and cheapest way, soil in houses and towns can be disinfected, converted into mould, and delivered back to the uses of agriculture, whilst leaving fields uncontaminated and rivers unpolluted.

The mortality of the South Midland and of the North Midland Counties was 20, in the Eastern, South Western, and West Midland Counties 19, in 1000. The three Northern Divisions are still by far the unhealthiest, not by nature, but by the negligence of the authorities, and defaults of the inhabitants; but in these counties the evidence of improvements is encouraging to the public spirit of their promoters. The mortality of the spring quarter in Cheshire and Lancashire was at the rate of 24, in Yorkshire 23, in the northern counties 24, in 1000.

In Wales and Monmouthshire the mortality is still high, but it is lower than it was in the spring quarter of last year.

In the sub-district of Winterton, Glandford Brigg, Lincolnshire, fever is still prevailing. The Registrar says :—

I have again to report the great prevalence of fever in Winterton. In the month of April the average number of cases of typhus and typhoid fever daily attended by me was 60, in May 50, and in June 30; altogether 100 were fresh cases of fever; which, in addition to 150 cases in the previous quarter, makes 250 cases of fever attended by myself since the 1st of January last. There have been 7 deaths from fever this quarter in Winterton. I am glad to report that there have been no fresh cases of fever in the last 10 days; and I have only 10 cases to attend at present, which, with one exception, are doing well. In addition to the above there have been many cases attended by two other medical men.

The condition of Northallerton in the North Riding of Yorkshire is unsatisfactory. The Registrar reports :—

The deaths have increased since the commencement of the quarter: April, 13; May, 20; and June, 22 deaths. The greatest mortality has been amongst children under two years. During the whole quarter the district has been in a very unhealthy state. At the commencement whooping-cough and measles were prevalent; at the same time the mortality from pneumonia and bronchitis was greatly above the average. Next followed low fever and typhus, the latter causing one death; afterwards small-pox, which prevails at the present time, but so far has only proved fatal in one case. Diarrhœa is now very prevalent.

Winterton derives its water from springs and wells in the town itself, which is drained but not efficiently by porous pipes. Cesspools and privies abound; only four or five closets empty themselves into the sewers. A full churchyard, with bodies lying above the road adds to the danger. Northallerton is drained by sewers, but has no organized system of water-supply; it has neither earth nor water closets. These two places pay a costly tribute to death.

Towns neglecting their sanitary defences, and exposed to diarrhœa, are in danger of falling the victims of some local eruption of cholera, which it must be borne in mind is still prevalent as an epidemic in Europe.

Third Quarter.—July, August, September.

The United Kingdom.—The Registers of the United Kingdom show that the *births* of 252,918 children, and the *deaths* of 142,168 persons of both sexes, were registered in the three months ending on *September* 30th. The recorded natural increase was 110,750; the native emigrants were 45,278.

The registered marriages of the United Kingdom in the quarter ending *September* 30th, 1867, were 54,669.

The death-rate of the United Kingdom differs little from that prevailing in England and Wales. The several facts concerning the other divisions of the Kingdom are set forth in the quarterly reports of the Registrar General of Scotland and the Registrar General of Ireland.

The resident population of the United Kingdom in the middle of 1867 is estimated at 30,157,473; that of England and Wales amounting to 21,429,508, of Scotland to 3,170,769, and of Ireland to 5,557,196. The corrected death-rate of the quarter is 19·5 per 1000; the birth-rate 34·7; the marriage-rate 15·2.

This Return comprises the Births and Deaths registered by 2200 Registrars in all the districts of England during the quarter that ended on September 30th, 1867; and the Marriages in 12,975 churches or chapels, about 5663 registered places of worship unconnected with the Established Church, and 641 Superintendent Registrars' offices, in the quarter that ended on June 30th, 1867.

England.—The marriage returns show that taking the increase of population into account the number of alliances formed has been below the average. The returns of births and deaths may be regarded with satisfaction; during the nine months ending 30th September the births have exceeded and the deaths have been below the average numbers.

Marriages.—In the summer quarter, ended 30th September, 88,172 persons were married. The marriages were 44,086; they were about 46,000 in the same period of each of the two previous years. In London the marriages were 8537 against 9038 in the corresponding three months of 1866; in the West Midland Counties they were 4948 against 5288; in the North-western Counties they were 7715 against 8067; and in Yorkshire 4792 against 5020. And by carrying the comparison of results through the eleven divisions of the kingdom, it will be seen that the marriage-rate was depressed by influences operating more or less powerfully almost everywhere, but chiefly in those parts that are the seats of manufacturing and mining industry.

The annual marriage-rate of the quarter was 16·3 per 1,000 (viz. persons married to 1000 of the population). The average marriage-rate for the corresponding period in ten previous years (1857–66) is also 16·3 per 1000.

Births.—The births of 190,782 children were registered in England during the summer quarter (July, August, September), a number greater than has ever been recorded during the same period, and 11,686 more than were registered in the summer of 1866. The average annual birth-rate of the season is 335 for ten thousand of the population; in the last quarter it reached the high proportion of 353. The increase is spread over each of the eleven divisions of the country, and the only counties which show a decrease are Northampton, Cambridge, Cornwall, Northumberland, and Monmouth.

A comparison of the birth-rates in certain large towns shows that the highest was in Leeds, where it reached 433 in ten thousand of population. In Sheffield it was 409; in Salford 396; in Glasgow 394; in Liverpool 388; in Birmingham 377; and in Manchester 376.

Increase of Population.—The natural increase of population, as represented by the excess of births over deaths, amounted to 82,269 in the quarter, or an average of 894 daily.

A considerable number of persons, however, left these shores for various parts of the globe, and the returns from all ports in the United Kingdom, at which there are government emigration officers, show that 45,278 (or an average of 492 daily) persons of native origin emigrated during the three months. Of these 34,853 went to the United States, 5,340 to British North America, 4,155 to the Australian Colonies, and 930 to all other places. 17,983 of the emigrants were of English origin, 4,485 of Scotch, 22,810 of Irish. The number who left ports of the United Kingdom in the summer of 1867 exceeds by 8,654 the number who emigrated in the same period of 1866.

Prices, Pauperism, and the Weather.—A marked increase in the price of wheat has taken place during the three months, the average price per quarter having been 65*s.* 4*d.* as compared with 51*s.* in the summer of 1866, and 43*s.* 3*d.* in the same season of 1865; this represents a rise of 28 per cent. and 51 per cent. respectively. Potatoes are also 31 per cent. higher in price than in the summer of 1866. Influenced by the cessation

of the cattle plague, and probably also by a smaller consumption consequent on the diminished earnings of the labouring classes, the wholesale price of meat, at Leadenhall and Newgate markets, has fallen since the quarter ending 30th September 1866; the average price of beef has been $5\frac{3}{4}d.$ per lb., and mutton $6d.$ per lb. during the quarter just ended; this is a decrease of 6 per cent. in beef and 11 per cent. in mutton compared with the same period of 1866. As some compensation for the higher price of bread and potatoes it may be hoped that consumers will obtain the full benefit of the diminished cost of meat.

Pauperism continues to show a considerable increase in the number of persons receiving in-door and out-door relief; the average numbers relieved on the last day of each week in three summer quarters were—

	In-door.	Out-door.
Quarter ending 30th September 1865	117,172	719,589
" " 1866	120,955	717,553
" " 1867	129,838	743,977

Many interesting facts on the meteorological character of the past summer are related in detail by Mr. Glaisher in his Report, which is subjoined. He states that "the cold period, which set in on 3d June, "continued throughout July, and extended to 7th August; the weather

"some of the nights frosty." The mean temperature at Greenwich was 59°·7, or about the average of the same season of 96 years. The rainfall was 11·3 inches in the three months, which is 3·9 inches above the average of 52 summer quarters.

Deaths; and the State of the Public Health.—The number of deaths registered in the three months that ended on 30th September was 108,513; and the annual rate of mortality was 20·1 in a thousand; the average rate of the season is 20·3, and in the same three months of 1866, when cholera was epidemic in London and other places, the rate was 21·8 per thousand. Fewer deaths have been registered, and the rate of mortality has been lower than in any corresponding quarter since 1862.

The summer has been favourable to health, and there has been no recurrence of epidemic cholera, although its prevalence has been remarked in some continental cities.

The death-rate experienced by about eleven millions of people inhabiting the chief towns was 22 per 1000, while rather more than nine millions of persons residing in the small towns and country parishes had a mor-

tality of somewhat less than 17 per 1000; it is far from being the case that this latter population lives under conditions so favourable to health as not to be capable of improvement, but the higher mortality in the towns shows that much sanitary work remains there to be performed before a satisfactory state of public health can be attained.

In London and twelve other great towns in the United Kingdom the annual death-rate during the quarter was 24 per thousand; it was highest in Manchester 32, and lowest in Bristol 19 per thousand; in London it was 21, Birmingham 26, Liverpool 29, Salford 28, Sheffield 24, Leeds 29, Hull 26, Newcastle-upon-Tyne 30, Edinburgh 23, Glasgow 24, and Dublin 23. The Registrars in many of these towns allude to the prevalence of diarrhœa, measles, scarlatina, typhus, and whooping-cough.

The unhealthy condition of Newcastle-upon-Tyne, with its numerous unpaved streets, its cellars and underground kitchens standing seven or eight inches under water and liquid filth, has been referred to in previous reports, and, notwithstanding the sanitary improvements instituted by the newly appointed Health Committee, zymotic diseases have been fatally

prevalent; in the All Saints sub-district, out of 229 deaths registered during the quarter, no less than 147 were those of children not exceeding 5 years of age; the hard working poor are described as crowding together, and in want of proper house accommodation; diseases generated in these localities spread among all classes of the population. The local authorities of this important town will probably see the necessity of appointing a permanent Medical Officer of Health.

Salisbury continues to furnish an instance of the advantages resulting from good hygienic arrangements; it is more than six years since the census was taken, and the present population of towns can only be approximately estimated, but, assuming that Salisbury has increased in population since 1861 in the same annual ratio as in the previous ten years, then the mortality during the quarter has been at the low rate of 10 per 1000 annually, a result as creditable to the authorities as it is satisfactory to the citizens, whose years of life are prolonged; that the healthiness of this city is mainly owing to the sanitary system now in operation, and not chiefly to advantages of situation, is proved by the fact that during the ten years 1841–50 the average annual number of deaths was 28 per thousand living, and in the following ten years it was 24 per thousand; it also suffered severely from epidemic cholera in 1849.

The Registrar of the Lockwood sub-district of Huddersfield states that—

The health of the inhabitants is very much improved by the Local Government Boards of Lockwood and Linthwaite partially carrying out the beneficial provisions of the Local Government Act, 1858, and other Acts incorporated therewith. This quarter there have been no cases of small-pox, measles, scarlatina, or whooping-cough.

This gratifying result should incite the authorities of other towns to endeavour to place the inhabitants beyond the reach of epidemic diseases.

Sickness is frequently induced by families occupying recently built houses before the walls have had time to get sufficiently dry; the Registrar of the Chadderton sub-district of Oldham furnishes an instance of this practice resulting fatally; he says:—

Dwelling houses are in such demand that parties go to reside in them whilst the plastering is still wet; in one house a family did so, the plaster being in a state that you might take marbles and imbed them in it; the whole of the family were seized with fever, and 2 deaths from typhoid fever occurred in the house.

Of the eleven great divisions of England the rate of mortality during the quarter was lowest (15·9 per 1000) in the South Western Counties, and highest (23·8 per 1000) in Cheshire and Lancashire; the Tables show the proportion in each of the other Divisions.

Fourth Quarter.—October, November, December.

The United Kingdom.—The Registers of the United Kingdom show that the births of 243,488 children, and the deaths of 153,342 persons of both sexes, were registered in the three months ending on December 31st. The recorded natural increase was 90,146; the native emigrants were 30,453.

The registered marriages of the United Kingdom in the quarter ending December 31st, 1867, were 65,856.

The death-rate of the United Kingdom differs little from that prevailing in England and Wales. The several facts concerning the other divisions of the Kingdom are set forth in the quarterly reports of the Registrar General of Scotland and the Registrar General of Ireland.

The resident population of the United Kingdom in the middle of 1867 is estimated at 30,157,473; that of England and Wales amounting to 21,429,508, of Scotland to 3,170,769, and of Ireland to 5,557,196. The corrected death-rate of the quarter is 21·4 per 1000; the birth-rate 33·9; the marriage-rate for the quarter 18·3.

England.—In each of the four quarters of 1867 the marriage-rate suffered depression; it was in a marked degree less active than it had been in the three previous years. The condition of the people supplied less encouragement than it had done to form fresh family ties. The birth-rate, which had been high during three fourths of the year, was well maintained to its close; and another feature of the returns, which will be observed with gratification, is the unusually low rate of mortality last quarter. As compared with the four previous years, 1863–66, the whole of 1867 must be classed as healthy.

Marriages.—The marriages in England in the last (or autumnal) quarter of 1867 were 53,038; they were less than in the autumn of the previous year, when 55,363 were registered, and they were, in a greater degree, less than in that of 1865, when they numbered 56,988. Comparative infrequency of marriages was the rule over the kingdom; but was apparently due to causes of discouragement which operated chiefly on centres of trade and commerce. The following numbers, being the marriages in the three consecutive autumnal quarters of 1865–66–67, will show the decline in a few selected parts of the country:—In London 9738, 9103, 8527. In the South Western counties 3961, 3824, 3661. In the West Midland counties 6981, 6386, 6100. In Cheshire and Lancashire 8583, 8653, 8052. In Yorkshire 6285, 6129, 5905. In the

Northern Counties 3284, 3013, 3004. In Monmouthshire and Wales 3552, 3477, 3297.

The annual marriage-rate for the quarter, viz., proportion of persons married to people living, was 19·6 per 1000 against an average of 20·0. It was lower than in any previous autumn since 1862. The habits and circumstances of the people make the fourth quarter of the year more convenient for marriage than any other season; and the celebrations of the rite are in consequence most numerous at that time. The marriage-rate in the year 1867 was 16·7 per 1000 against an average of 16·9.

Births.—Of children born in the December quarter the number was 183,144, which is about 2450 less than it had been in the fourth quarter of the previous year. Fluctuations in the absolute numbers of births are seen in the seasons as they change with one another; but it is seldom that there is a decrease in one year as compared with its predecessor; and when the comparison is extended further, the progress is steady and striking.

In particular districts a decrease in the number of births registered is assigned by the registrars to want of work; as amongst Cornish miners, many of whom have emigrated for that reason to America. Depression in the coal and iron trade had caused many persons to leave West Bromwich for other districts; and Darlaston (Walsall) had also lost part of its population this way.

The annual birth-rate of the quarter was 33·8 per 1000 persons living. The average derived from ten previous quarters (in 1857–66) is 33·4 per 1000.

In large towns the birth-rate is higher than that obtained for England. But Bristol, where it was only 33·6 per 1000, formed an exception to the rule. In London it was 35·3, in Edinburgh 36·9, in Liverpool 38·3, in Glasgow 39·5, in Hull 39·9.

Increase of Population.—The births in the last quarter exceeded the deaths that occurred in the same time by 66,947; and this excess is the natural increase of population, a certain portion of which is required to fill the vacant places of those whom death spared but opportunity removed to other parts of the world.

The number of emigrants in the quarter that ended 31st December from ports in the United Kingdom where there are Emigration Officers was 35,472, of whom about 12,151 were persons of English origin, 2938 were of Scotch, and 15,364 of Irish origin. Four-fifths of the aggregate movement went to the United States.

*oximated to the results of Robinson's Anemometer by reductions from Whewell's up to 1859.

Prices, Pauperism, and the Weather.—The price of wheat has been rising steadily in the last two years, and its average price in the four successive quarters of 1867 was 60*s.* 7*d.*, 63*s.* 11*d.*, 65*s.* 4*d.*, and 67*s.* 11*d.* per quarter. Potatoes were also dear last year, and the mean price last quarter (132*s.* per ton) for the best quality at the waterside market in Southwark was nearly twice as high as it was at the end of 1865. Beef as sold by the carcase at Leadenhall and Newgate markets varied little in price last year, and last quarter it averaged 4½*d.* per lb. for inferior quality and 6¾*d.* for the best. Mutton became cheaper in the latter half of the year, and in the last quarter the mean price ranged from 4½*d.* to 6½*d.* per lb. according to quality.

Mr. Glaisher's Meteorological Tables prepared from returns obtained from more than fifty stations, and his comments, are published with this Report. The weather was cold with much fog from the 1st October to the 13th October; from the latter day the weather was warm everywhere for five days, and rain fell daily; during the rest of the month the weather was generally mild with frequent rain and dampness of the atmosphere. In November the temperature was sometimes above but chiefly below the average; the month was one of the finest Novembers that have ever been known, with little fog, and with less rain than has fallen in that month for fifty years. A sudden change occurred in the first week of December. Rain, hail, sleet, and snow fell in various parts, and a hurricane caused great destruction by sea and land. On the 11th the frost vanished, and for seven days the weather was very warm, and afterwards till the close of the year it was changeable, with clouds and fogs, and much rain all over the country. The mean temperature at Greenwich was below the average in each of the three months; that of the quarter was 42°·5, which is 2°·5 below the average of the same period in 26 years. The rainfall was 4·5 inches, which is 2·6 inches below the average. It was in defect in October, defective by 2 inches in November, and slightly in excess in December.

The returns of pauperism are heavy: the average numbers relieved on the last day of each week in the quarter were in-door 146,237, out-door 771,230. In the December quarter of 1865 the respective numbers were 129,036 and 725,259.

Deaths; and the State of the Public Health.—In the three months that ended 31st December, 116,197 deaths were registered in England. In the same period of 1866 the number was 117,352, in that of 1865 it was 121,245. To find at two intervals a decrease of deaths in an increased

population is a satisfactory circumstance. The south-western counties and chiefly Devonshire and Somersetshire, appear advantageously in the Tables. The northern counties, consisting of Durham, Northumberland Cumberland, and Westmorland, were ravaged by scarlatina, and consequently yield less favourable results.

The deaths in London were 18,526. In four of the thirteen weeks they were above the average (corrected for population); in the remaining nine they were below it. There was more than the usual amount of bronchitis in some weeks of November and December, when the temperature was low, but zymotic diseases showed no extraordinary prevalence.

The annual rate of mortality in England in the last quarter was 21·4 per 1000 (deaths to 1000 living), against an average for ten December quarters (1857–66) of 22·2 per 1000. It was lower than it had been in any quarter of that series except those of 1860–61.

Both town and country districts experienced the reduction of the death-rate, for in the former the mortality was 23·8 against an average of 24·8, and in the latter it was 18·2 against 19·2. The south-western counties, the south-eastern, and the eastern were the three healthiest divisions, their respective rates of mortality having been 17·7, 18·1, and 18·4. The division comprising Monmouthshire and Wales was remarkably healthy, for the death-rate in it was also under 19; but its mining districts, it is not improbable, have been seriously thinned by emigration. In the northern and north-western counties, dotted with large town populations, it rose to 24·7 and 26·3 per 1000.

By comparing the THIRTEEN LARGE TOWNS of the United Kingdom it is seen that in four, namely, Salford, Newcastle-on-Tyne, Liverpool, and Manchester, the death-rate ranged from 29·2 per 1000 in the first to 32·6 in the last; in Birmingham, Hull, and Edinburgh it was 26 and under 27, and in Glasgow 27·8. In London it fell to 23·6; which is but slightly in excess of that which was obtained for Dublin. The late Mr. Bryson, the town surveyor of Newcastle, in his report to his Committee, while admitting that great improvement in the sanitary condition of the borough has been effected, states that "much still remains to be done," and strongly laments the want of good accommodation for the working classes, without which he does not expect that the death-rate can be materially reduced. Mr. Errington, registrar, writes, in corroboration of this report, that many of the houses in the overcrowded parts of Newcastle are wholly unfit to be inhabited by human beings.

A summary review of the national registers furnishes proof of a favourable state of the public health viewed in comparison with that of former seasons; but there are exceptional facts that cannot be regarded with like com-

Note.—The above mortality for the *year* 1867 is the mean of the quarterly rates.

placeney ; for it is impossible that the elements of nature, however happily blended to constitute a fine autumn, can successfully contend with human ignorance and neglect, can suddenly counteract poisonous emanations from drains and from marsh lands covered with hovels, or sweeten well water that has been contaminated with sewage. It is found that in different situations there were outbreaks of fever which the local officers attribute to overcrowding, bad drainage, or otherwise defective sanitary condition ; they were not confined to towns, but occurred equally in the purer atmosphere of the country. Such outbreaks are at all times numerous enough, and if they were all reported would probably be found more numerous still. They occur in the secluded hamlets of thinly-peopled districts, where inspectors of nuisances are unknown ; where the doctor, when summoned, is too busy with his patients to explore their surrounding conditions ; and where, as fevers may be prevalent without being fatal, it is obvious that even an intelligent registrar living at a distance, it may be of some miles, has but imperfect means of acquainting himself with authenticated facts. Epidemic disease is rapid in its origin and progress ; the art of sanitation, as applied by public bodies, is slow and often difficult. What may be done with the present consent of all, and the prospect of certain benefit in the end, is the wide diffusion of sanitary knowledge among all classes, not excepting the rich. People must be taught to protect themselves. If wells in the neighbourhood of drains are fraught with danger, the fact should be made familiar to all ; and if there be a simple and ready means of detecting pollution in water, that too should be universally known.* Short and easy lessons on the physical forces, or animal and vegetable physiology, on health and longevity, should be interspersed in elementary school books, with sketches in natural history narratives of adventure, and other more attractive matter.

In the parish of Terling, in the sub-district of Witham, Essex, with a population of about 900, typhoid fever broke out, and there have been about 180 cases. The Registrar reports that, from the 14th to the 31st December there were 12 deaths from it, 11 of which occurred in nine days. The ages of the 12 persons who died ranged from four to forty-four years, and 9 of them were females.

The Registrar of Tamworth writes :—

"Deaths 48. There is an increase of 16 over those of the corresponding quarter of last year. There has been much fever in the borough of Tamworth in the last quarter, and I have registered 8 deaths from it. The town is in a very bad state, abounding with nuisances, none of which are ever removed by the authorities. The mortality bears but a small proportion to the amount of sickness occasioned by the extremely filthy condition of the town."

The Registrar of the sub-district of Northowram (Halifax) says :—

"Deaths 123. 9 were from measles, 10 from typhoid fever, and one from typhus. In the last general return, attention was called to the prevalence of typhoid fever in the northern portion of the district, within the jurisdiction of the Queensbury Board of Health. I regret to say that the fever continues there."

It appears that in the six months from 23d April to 23d October 29 persons had died of the fever, and probably 500 or 600 had been attacked. Well water is drunk, and it is stated that the drainage is exceedingly bad.

The Registrar of Earsdon (Tynemouth) remarks :—

"Deaths 74. Scarlatina has been very prevalent during the past quarter, and 29 deaths have been registered from this cause. The cottages for the occupation of workmen employed at the collieries (in part of my sub-district) have been erected in low and marshy situations, and evidently without any regard to sunlight or drainage. Recent legislation has, however, had the effect of drawing the attention of the colliery proprietors to the sanitary state of their cottages ; and those now being erected by Mr. H. Taylor at East Holywell colliery are so placed as to receive the largest amount of sunlight. The drainage, ashpit, and other accommodation are excellent, and an ample supply of pure water is provided."

* See letter in the *Times* of the 18th January 1868 by Mr. Attfield.

Typhus or typhoid fever was reported in the parishes of Therfield and Guilden Morden, Hertfordshire; in that of Sutton St. James, Lincolnshire; at Winterton in the same county; at Westhoughton (Bolton); and is attributed to the existence of nuisance or other sanitary wrong. Scarlatina prevailed fatally in the sub-district of Kessingland, Suffolk; at Leek, where it caused a third part of the 96 deaths; at Stourbridge; in Birmingham and Stockport; in Ormskirk; at Wigan, where out of 377 deaths 87 were caused by that disease; at Hulme (Chorlton), where it caused 91 out of 614 deaths; at Manchester, Ashton-under-Lyne, Royton (Oldham), where it has been severe and caused 28 out of 78 deaths; at Towlaw in Durham and other parts of the same county; at Tynemouth, Bedlington, Penrith, Carlisle, Cockermouth. At Workington 53 deaths out of 125, and at Kendal 41 out of 106 were from scarlatina.

An eruption of fever occurred in the Royal Marines' Barracks of East Stonehouse, which is stated to have arisen from polluted water of a well supplied from a large natural cavern, on the top of which, or near it, houses had been built.

Health of London in 1867.

THE Weekly Returns of London for the year 1867, a summary of which is now presented, contain the Births, Deaths, and Causes of Death in a population which is estimated to have been at the middle of that year 3,082,372. This great and unrivalled aggregation of human beings, living in high and low degrees of density, covered a surface of 122 square miles, intersected by the river, which separates 51 square miles, with about three fourths of the whole population, on its northern bank, from 71 square miles, with the remaining fourth of the inhabitants, on its southern side. Over this area were scattered 46 workhouses, 12 prisons, 4 military and naval asylums, 31 civil hospitals, 8 military and naval hospitals, and 19 lunatic asylums. The facts were collected and recorded by 135 registrars.

During the year 112,691 births and 70,924 deaths were registered. The male births and the male deaths were in excess of the female births and deaths respectively, notwithstanding the preponderance of the female element in the population of the metropolis, which is as 114 to 100. The year 1866 was fatal to nearly 10,000 persons above the number who died in 1867.

The rate of mortality was 23·0 per 1000 persons living (in males 25·3, in females 20·9). This rate can be advantageously compared with those of the previous five years, which were successively 23·6, 24·5, 26·5, 24·6, and 26·5 per 1000.

If the rising and falling rate of mortality be taken as the criterion of health, the year 1867 was the healthiest that London has enjoyed since 1860. Through the four years that followed 1860 the annual mortality uninterruptedly rose, and reached 26·5 per 1000 in 1864. It then began to decline, and probably the decrease would have continued in 1866 if cholera had not attacked London in that year. In 1867 it was, as has been stated, 23·0, against an average of 24·4.

When the metropolis as a whole is compared with the principal northern towns, its three millions have reason to be satisfied with the position it holds in the mortality tables. If its worst districts, such as St. Giles, St. Luke, East London, Whitechapel, St. George-in-the-East, Southwark, are compared with the worst of the English provincial towns, the comparison is not unfavourable, though it is in a much less degree advantageous to the sanitary reputation of London. In Birmingham the death-rate of 1867 was 24·3, in Sheffield 24·7, in Liverpool 29·6, in Newcastle-on-Tyne 30·8, in Manchester 31·4. In Dublin it was 27·1, in Edinburgh nearly the same, in Glasgow 28·5. It has been stated that "nothing but "the great quantity of rain that falls in Manchester makes residence "within that city tolerable: it washes down the noxious products with

"which the atmosphere is charged." In a comparison of thirteen large towns in 1867 Manchester shows the highest mortality, and also, with exception of Salford and Glasgow, the highest amount of rain (34·9 in.) The rain of Liverpool measured only 25·4 in. last year; that of Glasgow the enormous amount of 45·8 in. The five leading Divisions of London, viz., the West, North, Central, East, and South groups of districts, also exhibit differences of death-rate; all of those large areas being planted wholly or partially with thick populations, and those being the healthiest that are endowed most liberally with open space. The Central Group, which includes St. Giles, Strand, Holborn, Clerkenwell, St. Luke, East and West London, and City, suffered a mortality of 24·4 per 1000. The Eastern Districts, comprising Shoreditch, Bethnal Green, Whitechapel, St. George-in-the-East, Stepney, Mile End Old Town, and Poplar, had a death-rate almost the same, namely, 24·2. In the Northern Group, Marylebone, Hampstead, Pancras, Islington, and Hackney, it was decidedly less, having been 23·1. The Western Division, which includes Kensington, Chelsea, St. George Hanover-square, Westminster, St. Martin-in-the-Fields, and St. James Westminster, was, in the four years 1863–6, the healthiest of all the five divisions, but last year its death-rate was in excess, though only in the slightest degree, of that which prevailed in the South Districts. In the West the rate was 22·1; in the South 22·0.

This last Division, stretching on the Surrey side of the river from its western limit at Putney to Greenwich and Woolwich in Kent, has an area almost six times as great as the East and Central Divisions together, but a population which does not equal that of these two divisions combined. In it there is still abundance of uncovered ground; there are also compact masses of population, chiefly where Lambeth, St. George Southwark, St. Saviour, St. Olave, Bermondsey, and Newington lie within the northward sweep of the river. Wandsworth, Camberwell, Rotherhithe, Greenwich, Lewisham, complete the South Division. A review of the Tables apparently justifies the observation that in none of the London divisions are the signs of sanitary improvement more legible than in this extensive southern section. In the four quinquennial periods between 1845 and 1864, the rates of mortality were consecutively 28·2, 25·8, 22·9 and 23·3. Last year the mortality declined, as already mentioned, to 22·0. Within these 20 years the water supplied to the South districts, the previous quality of which was exceedingly bad, has been much improved. When extensive clearances have been made for new railways, the formation of streets, or other operations, the hardship inflicted on the working classes by ejectment from their dwellings in central and confined districts such as Clerkenwell and Somers Town, would, it may be conjectured, be less

LUNATIC ASYLUMS													

† This Table is compiled from the Weekly Returns made by the Registrars of London, and relates to the 52 or 53 weeks of each year.

severe, and less attended with dangerous overcrowding, in those on the south side of the river, where the population had ampler room to expand, and house accommodation was less difficult to be obtained. In estimating the fruits of sanitary labours in the older neighbourhoods, it should not be forgotten that the condition of populations increasing rapidly within fixed boundaries has a constant tendency to deterioration,—that the rate of mortality uncontrolled must rise; and if there be reasonable ground to believe that the great engineering works that have been undertaken in the interest of the public health have checked this tendency, and, though they have not extirpated epidemic diseases, have to some extent quelled their fury, this result must be regarded with satisfaction and hope.

The highest weekly number of births registered in London in 1867 was 2,489 in the last week of March; the lowest numbers of births were 1,910 in the third week of July, and 1,701 in the fifty-second week of the year, when Christmas shortened the period available for registration.

The highest weekly number of deaths registered was 1,891, and occurred in the second week of the year; the return rose again nearly as high (1,880) in the fourth week, but it exceeded 1,700 in only two other instances. The lowest number of deaths was 1,052, near the middle of June. In the first week of January the mean temperature of the air was 25°·2, and the mean of the lowest thermometrical readings was 17°·2. The mean temperature of the second week of June was 59°·9, and the mean of the lowest readings 51°. The difference between winter's cold and summer's heat caused a loss or saving of eight hundred lives in a week. But it does not follow that the prolongation of those temperatures through many successive weeks would produce effects of proportional magnitude. The third quarter of the year is the warmest, but in it the mortality is higher than in the second.

The great changes that have taken place within the metropolitan area in recent years in the demolition of old structures, the extension of thoroughfares, and migration of families into the suburbs, may be very

* For the years 1849-59 the results are only approximative, having been reduced to Robinson's Anemometer from observations made with Whewell's.

† By Robinson's Anemometer.

legibly traced in the Table of Deaths in the thirty-seven districts of London in each of the last ten years. In the three City Districts the decrease in absolute numbers of deaths is very conspicuous. St. Martin-in-the-Fields and others are nearly stationary; St. Saviour Southwark and St. Olave show a great decrease. The mortality of Kensington has increased from 3,500 deaths in a year to 5,000. There is an increase in Marylebone but it is less remarkable. Hampstead, which registered 300 deaths ten years ago, now registers 400 annually. Pancras has suffered an addition of at least 500. In Islington the annual average was nearly 3,000 in the years 1858–60; it now approximates to 5,000; and Hackney exhibits an increase which is proportionably as great. The deaths in Lewisham, which were about a thousand, are now 1,400.

The total deaths in the year were 70,924, and of 70,586 of these deaths the causes were more or less fully and accurately described and recorded. Zymotic diseases, in which class the chief heads are typhus, small-pox, measles, scarlatina, whooping-cough, and diarrhœa, were fatal in 15,301 cases, which is more than a fifth part of the whole. This aggregate result was, however, considerably less than it had been in any previous year since 1860; and the only disease in this class which displayed increased activity was small-pox, the deaths from which were 1,345. This complaint was prevalent chiefly in the March quarter, and in the remaining nine months declined. Part of Lambeth suffered from it; but its chief points of attack were apparently Limehouse, Bow, Poplar, Bermondsey, Deptford, and Greenwich. Whooping-cough carried off many children all over London; and diarrhœa, which was the most fatal of the zymotic class, caused 2,969 deaths. Cholera, chiefly *cholera infantum*, was fatal in 240 cases; typhus, typhoid fever, &c., in 2,184 against 3,232 and 2,681 in the two previous years.

There were 7,613 deaths from bronchitis, 3,700 from pneumonia, 8,928 from phthisis, 2,993 from heart disease, 46 from privation, 118 from purpura and scurvy, 170 from delirium tremens and intemperance, 2,191 from accident or negligence, 108 from homicide, 259 from suicide, 3 public executions, 47 other violence not described.

The thorough systematic cleansing of the streets and the regulation of the traffic on them are subjects which urgently claim public attention. 164 deaths from injuries caused by horses or vehicles in the streets were recorded in 1867. 10 persons were killed by horses, 3 by carriages, 7 by omnibuses, 17 by cabs, 32 by waggons, 5 by drays, 43 by carts, and 47 by vehicles not described.

Average Number living to One Death annually (1840–67)	41	44	44	40	38	40

NOTE.—The Annual Rate of Mortality in this Table is deduced from the Population at the Censuses of 1841, 1851, and 1861, and from the Deaths registered in London in each of the several years.

The Mortality for LONDON in each year, 1840-67 is calculated on the Deaths for the complete years, instead of for 52 or 53 weeks.

1867 -	**30,551,276**	14,864,733	15,686,543
1868 -	**30,774,590**	14,950,520	15,824,070
1869 -	**31,015,234**	15,043,923	15,971,311

* In estimating the number of men in the Army, Navy, and Merchant Service abroad, a certain proportion belonging to foreign countries and the colonies has been excluded. In 1811 the troops and seamen were 640,500, but as this number included natives of colonies and foreign parts, only 502,536 were taken.

[The above numbers (1801–61) have been deduced by raising the enumerated population of the United Kingdom, including the islands in the British Seas, (*see* Table 9. p. 84. of Vol. III. Census of England and Wales, 1861,) up to the middle of the respective Census years. In 1866–1869 the numbers have been estimated by adding the population enumerated in the islands in the British Seas in 1861, and the number of men in the Army, Navy, and Merchant Service abroad, (*see* Tables 3. and 16. pp. 81. and 87. Vol. III. Census 1861,) to the population for 1866–7–8 and 9, returned in Table 59. pp. lxiv–lxv.

conjunction with the Registrars-General of Scotland and Ireland. The population of the Seas is not included.

ARRANGEMENTS respecting the **Registration** of BIRTHS, DEATHS, and MARRIAGES in the **British Colonies** and **Possessions.**

Letter from the Registrar-General to the Under Secretary of State, Colonial Office.

General Register Office, Somerset House, London,
SIR, 5th April, 1867.

IT not unfrequently happens that applications are made to me by persons who require for legal purposes connected with the succession of property, or for life insurance, certificates or other documentary evidence of Births, Deaths, and Marriages which have taken place in British Colonies and Possessions of the Crown ; applicants addressing themselves to me in the belief that I am able to assist them in procuring the required documents, or at least to furnish them with information as to the steps they should take to obtain them.

In the case of the Australian Colonies, being aware that a system of registration of these events has been established under a Registrar-General in each colony, I have had no difficulty in advising the applicants how to proceed ; but with respect to other colonies, I have been unable, from want of information, to render them any assistance.

It appears to me desirable that this department, to which persons naturally resort in such cases, should possess information as to the existing arrangements for recording Births, Deaths, and Marriages in the colonies.

I have therefore to request that you will submit to the Secretary of State whether his Grace will be pleased to direct that a list be furnished to me of the names of the officers in the several colonies charged with the duty of superintending the registration of these events, together with any further information on the subject which his Grace may see fit to place at my disposal.

I have, &c.,
(Signed) GEORGE GRAHAM,
Registrar-General.

To the Under Secretary of State,
Colonial Office, Whitehall.

Letter from the Under Secretary of State, Colonial Office, to the Registrar-General.

SIR, Downing Street, 24th April, 1867.

I HAVE laid before the Duke of Buckingham and Chandos your letter of the 5th instant, and I am directed to acquaint you in reply, that it is difficult to furnish with accuracy from the records of this office the information which you desire with regard to the officers in the several colonies (Australia excepted) who may be charged with the duty of superintending the records of Births, Deaths, and Marriages. His Grace will address a circular despatch to the governors of those colonies, directing them to send home in each case an authentic return, and any information which may assist you ; and in the meantime I transmit to you, for immediate use, such information as it has been possible to supply in this office with reference to the North American and African Colonies, and Malta. No information can at present be supplied with regard to the West India Colonies.*

I am, Sir,
Your most obedient Servant,
FREDERIC ROGERS.

The Registrar-General,
Somerset House.

---

* A précis of the information subsequently obtained and forwarded to the Registrar General by the Secretary of State is given at pp. lxxv-vi, *post.*

AUSTRALIAN COLONIES.

VICTORIA.—By an Act of the Legislative Council passed in 1853, the registration of births, deaths, and marriages was established, and a department for that purpose was organized under the direction of the present able Registrar-General, Mr. W. H. Archer. The schedules in use in Victoria were drawn up in accordance with the recommendations of the Registration Committee of the Statistical Society of London,* and the records of marriage, birth, and death contain, therefore, many more details than are given in the English schedules. The law in respect of the registration of births and deaths differs from that in force in England in some respects. Thus the amended Registration Act, passed in 1865, requires parents or occupiers to give notice of a birth *within sixty days*, of a death *within fifteen days*, to the Registrar, under a penalty not exceeding 10*l*. Registration of birth after the expiration of sixty days is permitted, under special regulation, but after the lapse of *twelve months* no birth can be registered unless the child was born at sea. No dead body may be buried without a certificate of registry or of inquest, unless notice thereof be given to the registrars within one month; and undertakers are required (under a penalty of 5*l*.) to forward to the registrars certificates of all burials performed by them, as by section 31 of the Act "no "entry of the register of any death shall be received as evidence of the fact of "such death unless there shall also be an entry of the register of burial." The Act makes no mention of *medical practitioners*, and any legal informant can state the "cause of death"; the registrar being further unauthorized to question the qualification of any practitioner who certifies the cause of death. All registers of births and deaths are to be made in duplicate, and of marriages in triplicate, each copy bearing the original signatures of the informants, parties, witnesses, &c. No provision is made in the schedules for still-born cases, but the deputy registrars are instructed to procure information of such cases wherever possible, and to report their number to the Registrar-General periodically. The allowance paid to the deputy registrars by Government is the uniform sum of 2*s*. 6*d*. for each correct entry of birth and death; certificates of birth and death are given by the deputy registrars on payment by applicants of 2*s*. 6*d*., in addition to a fee of 5*s*. for the search: this last fee is not required in cases of very recent birth or death, when the indexes do not need to be referred to. Marriages, whether in places of religious worship, in registrars' offices, or in private dwellings, are regulated by the provisions of "An Act to consolidate the Laws relating to Marriage, and to de-"serted Wives and Children, and to Divorce and Matrimonial Causes" (28 Vict. No. 268.), and are registered by the minister, Registrar-General, or other officer by whom they are celebrated. The schedules (in specimen) for Marriages, Births, and Deaths used in Victoria are appended.

Form of Marriage Declaration before Minister, Registrar-General, or other Officer.

I, *Charles Brown, of Russell Street, Melbourne, Storekeeper*, being duly sworn, make oath and say [*or if objecting to take an oath*, "do solemnly and sincerely declare and affirm"], that I am a *bachelor*, and am *above* the age of twenty-one years, and that I have no knowledge of any just impediment or lawful objection, by reason of any kindred, relationship, or alliance, or any former marriage, or the want of consent of parents or guardians, or any other lawful cause whatever, to my being married to *Charlotte Simpson, of Howard Street, North Melbourne, Dressmaker*, daughter of *John Simpson, late of Sydney, Mariner:* And I hereby further declare that I have full knowledge that in swearing or affirming falsely in this matter I am guilty of perjury, and liable to the pains and penalties thereof.

I, *Charlotte Simpson, of Howard Street, North Melbourne, Dressmaker*, being duly sworn, make oath and say [*or if objecting to take an oath*, "do solemnly and sincerely declare and affirm"], that I am a *spinster*, and am *under* the age of twenty-one years, and that I have no knowledge of any just impediment or lawful objection, by reason of any kindred, relationship, or alliance, or any former marriage, or the want of consent of parents or guardians, or any other lawful cause whatever, to my being married to *Charles Brown, of Russell Street, Melbourne, Storekeeper*, son of *Henry Charles Brown, of Exeter, England, Ironmonger:* And I hereby further declare that I have full knowledge that in swearing or affirming falsely in this matter I am guilty of perjury, and liable to the pains and penalties thereof.

Signatures { *Charles Brown.* / *Charlotte Simpson.*

Declared and sworn [*or* "affirmed"] by both the parties named, this *first* day of *June*, 1865.

Signature and designation, whether Minister, Registrar-General, or other Officer. *James Smith, Registrar of Marriages.*

} Registration system similar to that of *Victoria.*

NORTH AMERICAN COLONIES.

UPPER CANADA (*June* 1867).—A Board of Registration and Statistics exists in Canada, composed of the Minister of Agriculture, the Receiver-General, and the Provincial Secretary. Returns of births, deaths, and marriages are annually forwarded to this Board. The Act of the Consolidated Statutes of Upper Canada (cap. 72.) provides that every clergyman or minister who celebrates a marriage in Upper Canada shall enter in a book a true record of the marriage, and shall, on or before the 1st of February in each year, return a complete list of all marriages solemnized by him during the year ending 31st December next preceding to the registrar of the county in which the marriages have taken place. The Act of the Consolidated Statutes of Canada (cap. 331.) respecting the Census provides that each clergyman, teacher, or minister duly authorized by law to baptize, marry, or perform the funeral service in Upper Canada shall keep a registry showing the persons whom he has baptized or married, or who have died within his care, and belonging to his congregation; and the said registry is to be forwarded by him to the clerk of the peace of the county, or clerk of the city or town council of the city or town where he resides or officiates at the time, or is within five days after the 1st day of January in each year. Where there is no minister, then the head of the family is required to notify any such births, marriages, or deaths which have taken place in his family to the clerk of the township in which he resides, or, if there be none, to the nearest township officer. The clerk of the township is required to forward the returns to the clerk of the peace, and that officer must send them on to the Board of Census and Statistics on or before the 1st of January in each year.

From the report of the Select Committee on the Registration of Births, Marriages, and Deaths in Upper Canada (dated 11th September 1865) it appears that the returns required by the first-mentioned Act (cap. 72.) have been transmitted by the clergymen generally with considerable regularity, especially during recent years; but that the returns under the Census Act are so irregularly made as to be utterly worthless. This committee recommended that the duty of preparing returns of births, marriages, and deaths in each township should be assigned to the township clerks and assessors in each township, and that the clerks should report to the registrars of the county, who should transmit an abstract of those returns to the Board of Census and Statistics.

LOWER CANADA (*May* 1867).—The clergy of the various denominations in their respective districts or counties are required to deposit a copy of their registers of baptisms, marriages, and burials at the close of each year with the prothonotaries and clerks of circuit courts. These officers send to the Government every year an abstract statement of the numbers of baptisms, marriages, and burials recorded in the registers so deposited; but they keep no index of names nor possess any

facilities for referring to names, so that an inquirer must be acquainted with the name of the denomination which deposited the register, the year when deposited, and the prothonotary or clerk of circuit court with whom deposited.

NOVA SCOTIA (*October* 1867).—The Secretary of the Board of Statistics, in the Department of the Financial Secretary, is *de facto* the Registrar-General of the Province. The deputy registrars for the registration of births, deaths, and marriages send quarterly returns to the Board of Statistics of the entries and records made by them in their respective districts. Registration is conducted under the "Amended Registration Act" (passed on 7th May 1866), which requires that particulars of marriage shall be recorded by clergymen and deputy registrars; that parents or occupiers, or some person present at the birth, shall give notice of birth to the deputy registrar, that the birth shall be registered *within sixty days* under a penalty of two dollars for non-compliance, and that births at sea shall be recorded in a special register; that information of death shall be given before the interment of the body, or within ten days after, to the deputy registrar; that coroners shall communicate in writing the finding of juries in all cases of inquest to the deputy registrar within seven days after such inquests have been held; that "every medical practitioner who shall have been in attendance during the last "illness and until the death of any person shall, within seven days after the "death of such person, transmit to the nearest deputy registrar a certificate under "his signature of the cause of death, according to a form to be provided by the "deputy registrar; and it shall be the duty of every qualified medical practitioner "to apply for blank forms for this purpose;" and that deaths at sea shall be recorded in a special register.

NEWFOUNDLAND (*June* 1867).—By an old law of 1833 marriages are registered in the office of the Colonial Secretary, who is empowered to grant certificates. The Colonial Secretary's department is charged with the general registry, the system of which is unsatisfactory and imperfect.

BERMUDA (*May* 1867).—By Act No. 4 of 1865 the registration of births, marriages, and deaths was established, and a Registrar-General and district registrars were appointed, whose duties, fees, &c. were prescribed by the Act. Alphabetical indexes were to be made and kept to facilitate reference to the registers, and the Registrar-General was to compile and publish every year a summary of births, marriages, and deaths registered. Clause 7 of the Act (defining the obligations of the registrars and of the public in relation to registration) enacts that officiating ministers shall give information of marriages performed by them, and parents or occupiers shall give information of birth or death to the registrar, *within fourteen days* after such marriage, birth, or death shall have taken place. Coroners are required to furnish the registrar with particulars of inquests *within twenty-four hours* after they have terminated. Registration is permitted up to a limit of *twenty-eight days*, on payment of a special fee. Neglect to furnish information of marriages, births, and deaths as required by the Act is punishable by a penalty not exceeding 5*l.*, or imprisonment in default. "Provided "nevertheless, that notwithstanding the neglect of any such person as aforesaid "to give the proper information to the registrar, it shall be the duty of the regis- "trar, after the expiration of 28 days or earlier, if for any reason he shall deem it "necessary or expedient, to procure by all means in his power the best and most "accurate information respecting any birth, marriage, or death which may have "occurred within his district, but not to enter the birth, marriage, or death on "such information until after the expiration of the time last mentioned."

NEW BRUNSWICK (*May* 1867).—The Provincial Secretary states that "there are "no persons appointed to keep records of births or deaths. The clerks of the "peace in the several counties are required to keep a record of marriages."

PRINCE EDWARD ISLAND (*December* 1867).—The Lieutenant Governor writes: "There is not any record of births and deaths kept in this colony. By the Local "Act 2 William IV. cap. 14. the parties authorized to solemnize matrimony are "required to submit, within a period of six months, a certificate of the celebration "of each marriage solemnized by them to the surrogate of the island, and the "surrogate is required to record such certificates."

BRITISH COLUMBIA (*May* 1868).—No provision is made by law for the registration of births and deaths. Marriages should be registered, but the Marriage Ordinance is said to be defective, and contains no provision for the appointment of a registrar-general of marriages. The Governor of the Colony states (11th August 1868) that under present circumstances a general system of registration could not be worked satisfactorily on account of the scattered population, and the conditions under which many of them are living.

FALKLAND ISLANDS (*August* 1867).—Registration was established by an ordinance in 1853. Clergymen are required to keep registers of baptisms, burials, and marriages, and to send copies of all the marriage entries to the registrar.

WEST INDIAN COLONIES.

JAMAICA (*June* 1867).—The Bishop's Registrar records all the births, deaths, and marriages occurring among the Episcopalian community; the marriages of Dissenters, Roman Catholics, and Presbyterians are recorded in the Secretary's office, but no record is kept of births and deaths occurring in those denominations.

BRITISH HONDURAS (*June* 1868).—There is no general registration of marriages, births, or deaths in the colony, but a register of baptisms, marriages, and burials has been kept in the parish church of St. John in Belize since 1812, and a similar register is also now kept in the district church of St. Mary: these registers are not kept in duplicate, and are liable to destruction at any moment. By Acts of the local legislature (14, 15, and 18 Vict.) records of marriages and burials performed by nonconformist ministers and others at Belize or elsewhere are to be transmitted periodically to the Colonial Secretary.

TURKS ISLAND (*June* 1867).—Registration of births, baptisms, marriages, deaths, and burials is provided for by an ordinance; returns are made by the registrars to the Colonial Secretary, in whose office the records are kept.

BRITISH GUIANA (*June* 1868).—Ordinance No. 10 of 1868, providing for the registration of births and deaths, is framed upon the model of the Irish Registration Act (26 & 27 Vict. c. 11.) The registration of marriages is provided for under an Order in Council.

BAHAMAS (*May* 1867).—For the purposes of registration the colony is divided into districts, and the registrars of births and deaths are required to inform themselves of every birth and death which takes place. Marriage officers are appointed in the out-islands where no clergyman of the Church of England or other minister resides, whose duty it is to solemnize marriages, and to transmit to the office of registry certified copies of the entries made by him. The general custody of the records of birth, death, and marriage in the colony is with the "Registrar of Records" at Nassau.

TRINIDAD (*December* 1867).—There appears to be a Registrar-General who is charged with the duty of superintending the records of births, deaths, and marriages in the colony.

BARBADOS (*May* 1867).—The only registration records are those of baptisms, marriages, and burials solemnized according to the rites of the Church of England; copies of these registers are sent in by the officiating ministers to the Colonial Secretary, under whose superintendence they are arranged and indexed, and in whose custody they remain.

ST. VINCENT (*June* 1867).—Births and deaths are registered under an Act passed in 1864, and the Colonial Secretary is *ex officio* the Registrar-General, having charge of the records. There is no registration of marriages.

GRENADA (*June* 1867).—The Colonial Secretary is the Registrar-General of births, deaths, and marriages.

ST. LUCIA (*July* 1868).—An ordinance for the registration of births and deaths was passed in March 1868. The records of marriage are very imperfectly kept, under the provisions of two ordinances dated 1667 and 1838.

ANTIGUA (*November* 1868).—An Act for registering births and deaths came into operation in August 1856; no provision was made therein for a general registration of marriages, but those solemnized by ministers not belonging to the Church of England continued to be recorded under an Act passed in 1844. An Act for the complete registration of births, marriages, and deaths has, however, been passed by the legislature, to come into operation on 1st January 1869.

MONTSERRAT (*July* 1867).—By an Act passed in October 1861, the registration of marriages, births, and deaths was established. Registrars are required to inform themselves of every birth and death happening within their districts, and to register them in due course. Parent or occupier must personally give information of birth to the registrar, within 21 days, under a penalty of 20*s.*; and some person present at the death, or other qualified informant, must within eight days personally give notice to the registrar of the death, under a penalty of 20*s.* Persons solemnizing marriage are required to send certificates to registrar. Indexes to the registers are kept at the office of the Registrar-General.

ST. KITTS (*October* 1868).—Births and deaths are registered under an Act passed in 1858, and marriages are recorded by the several ministers of religion under an Act passed in 1845.

NEVIS (*June* 1867). The system of registration of births and deaths established by law has been in operation since 1st January 1862. The Colonial Secretary acts as the Registrar General, and there are five local Registrars who receive 1s. for each birth or death recorded.

VIRGIN ISLANDS (*November* 1867).—The Colonial Secretary is *ex officio* the Registrar-General of births, deaths, and marriages.

DOMINICA (*June* 1868).—An Act for the registration of births, marriages, and deaths was passed in 1860, and is now in operation. By that Act the registration of every marriage, birth, and death is enforced under a penalty of 2*l*. Certified copies of all entries by registrars and ministers of religion are required to be sent periodically to the Registrar-General of the island.

TOBAGO (*June* 1867).—There is no civil registration of births, deaths, and marriages, and the only information obtainable in reference to those events is in the hands of the ministers of religion, who register the baptisms, funerals, and marriages which they perform.

MEDITERRANEAN AND AFRICAN COLONIES.

GIBRALTAR (*May* 1867).—There is an officer charged with the duty of superintending the records of births and marriages. An ordinance for the registration of deaths was promulgated on the 13th December 1868.

MALTA (*May* 1867).—The registration of births, marriages, and deaths was provided for by an ordinance (No. 2.) in 1862, and the records are kept in the Public Registry offices of Malta and Gozo. The ordinance specifies in detail the various regulations for the performance of registration, the duties of the officers and the public, and the penalties for non-compliance. Alphabetical indexes to the registers are to be kept. Notice of birth is to be given within five days to the registrar, whether the child be living or still-born; children born at sea and foundlings are also to be enrolled in the registers. Illegitimate children may be legitimated *per subsequens matrimonium*, or by decree of the competent authority. Certificates ("acts") of marriage are to be presented to the registrar within 15 days, for entry in the register, under pain of punishment of the parties; but registration is declared "not necessary for the validity of marriage." Secret marriages (*matrimonia conscientiæ*), which, according to the existing laws and usages, are not entered in the parochial registers, are not subject to the obligation of registration prescribed by the ordinance. Notice is to be given "without delay" to the registrar of the occurrence of a death, and a certificate of the cause of death is to be given by the medical man in attendance during the last illness; the cause of death is, however, not entered in the "act" or certificate of death. Certain persons are exempted from the provisions of this ordinance.

SIERRA LEONE (*May* 1867).—There is a Registrar-General who keeps registers of births, deaths, and marriages.

GAMBIA (*May* 1867).—Registers of births and deaths are kept by a registrar.

LAGOS (*June* 1868).—A registrar of births, deaths, and marriages has been appointed.

CAPE OF GOOD HOPE.—A death register is kept in the office of the Master of the Supreme Court.

ST. HELENA (*November* 1868).—The laws providing for the registration of births, deaths, and marriages were framed from and are similar to the registration Acts in England.

HELIGOLAND (*July* 1867).—The clergyman superintendent of Heligoland has charge of the records of births, deaths, and marriages occurring in the colony.

EASTERN COLONIES.

CEYLON (*February* 1868).—By Ordinance No. 6 of 1847 provision was made for the better registration of marriages, births, and deaths. The provisions in relation to the registration of marriages were amended by Ordinance No. 13 of 1863, and further by Ordinance No. 8 of 1865. Notice of intended marriage must be given to the registrar of the district for publication in his office and elsewhere, and at any time between 21 days and three months after the entry of the notice the registrar is required to issue the certificate for marriage, except in cases where it is forbidden by some one whose consent is necessary. Marriages may be solemnized in registered places of worship, or contracted in the offices of the registrars. Particulars of marriages to be sent by ministers to registrars for enrolment in the registers. Legal marriage between parties legitimate children of same parties before marriage. The registration of births and deaths is now provided for by Ordinance No. 18 of 1867, which amends previous ordinance relating thereto. Registrars are required to inform themselves of births and deaths; parents and occupiers must give notice of births to registrar *within three months*; and no birth can be registered after the lapse of *two years*. Some person present at the death, or the occupier of the house in which it occurs, must within *eight days* after the death takes place give information to the registrar, and any person neglecting or refusing to give such information is subject to a penalty not exceeding 5*l*. The Registrar-General of the colony keeps certified copies of all the registers of marriages, births, and deaths occurring therein.

HONG KONG (*September* 1868).—The Governor states that reliable statistics of marriages, births, and deaths are not procurable. He considers that the measures adopted in Ceylon are inapplicable in Hong Kong, and he deems it "inexpedient " to run the risk of further exciting the suspicions and wounding the prejudices " of the large Chinese population, without the prospect of any better result than " the compilation of inaccurate statistics."

MAURITIUS (*July* 1867).—The system of registration of births, deaths, and marriages is similar to that of France, and information may be obtained relative to these matters from the Civil Status Office, or the Governor of the colony.

Letter from the Registrar-General to the Under Secretary of State, Colonial Office.

General Register Office,
Somerset House, London, 31st March 1868.

SIR,

REFERRING to your letter of the 30th January last, and previous communications, transmitting to me documents received from Colonial Governments relating to the existing arrangements for the Registration of Births, Deaths, and Marriages in British Colonies and Possessions, I have to request that you will do me the favour to express to the Duke of Buckingham and Chandos my thanks for the useful information with which his Grace has been pleased to furnish me, enabling me to answer without further trouble to the applicants or to the Colonial Office inquiries which are daily being made here by the public.

With reference to his Grace's desire to receive any suggestions which, on consideration of these various communications, may occur to me as calculated to improve the existing system of Colonial Registration, I have the honour to submit the following remarks:

I observe with satisfaction that the same considerations of public and private advantage which have led to the establishment of a system of registration in the United Kingdom and in the different continental states, have had equal weight, with few exceptions, in the colonial dependencies of this country. Amongst the exceptions, however, are some colonies in which it is evident, from the documents before me, that no sufficient provisions for the attainment of this object has yet been made. As instances I may refer to the colonies of New Brunswick, Prince Edward's Island, the Cape of Good Hope, British Honduras, and Jamaica; partial but insufficient arrangements appear to exist in Lower Canada, Antigua, St. Lucia, Barbados, Tobago, and British Guiana.

In some of these colonies attention has apparently been directed to the subject, but the endeavours made to improve the present defective arrangements have hitherto been attended with little success.

Perhaps it may be convenient if I take the liberty of stating, for the consideration of his Grace, what in my opinion are the principal objects to be kept in view in any local legislation on this subject, due regard being had to the circumstances of the locality.

I think they are—

1st. To provide a system of civil registration of Births, Deaths, and Marriages, including all classes and all religious persuasions.

2nd. That the forms adopted for registers should be such as, avoiding needless multiplications of statements, would clearly establish the identity of the persons recorded, and assist medical and statistical inquirers in useful research.

3rd. That registration districts should be formed where necessary, and a registrar appointed for each of such districts.

4th. That all registers should be kept in duplicate, one to be retained by the registrar, and the other to be transmitted periodically to a central office, where a superior authority should exist, and alphabetical indexes and abstracts should be prepared. If preferred, certified copies might be sent to the central office instead of making duplicate registers.

5th. The registration of Births, Deaths, and Marriages should be enforced by suitable penalties. The essential feature of the registers should be to make provision for the registering of all ranks of society, without interference with the institutions and rights of religionists of any class.

I observe that in Ceylon an excellent system of registration is now in force, which appears to me to be worthy of imitation.*

I have, &c.

(Signed) GEORGE GRAHAM,
Registrar-General.

To the Under Secretary of State,
Colonial Office.

[MEM.—A copy of this letter, together with a copy of the Ceylon Ordinances, appears to have been sent by direction of his Grace the Duke of Buckingham and Chandos to the governors of certain colonies in a circular to which some replies have recently been received.]

INDIA.

Letter from Registrar-General to the Under Secretary of State, India Office.

General Register Office, Somerset House, London,
5th April 1867.

SIR,

UNDER the provisions of the Act 14 & 15 Vict. c. 40., certificates of certain marriages in India are transmitted to me here periodically for the purpose of being deposited with the other records of the same character in this office.

It frequently happens that applications are made to me respecting certificates or other documentary proof of the births and deaths of Europeans in India, as also of marriages not celebrated in pursuance of the above-mentioned statute, such certificates being required for legal purposes connected with the succession of property, or for life insurance,

* This remark had reference only to the documents then under consideration and did not include any papers relating to the highly effective arrangements in force in Victoria and other Australian colonies.

&c., the applicants addressing themselves to me in the belief that I am able to assist them in procuring the required documents, or at least to furnish them with information as to the proper course to be taken to obtain them.

It appears to me desirable that this department, to which persons naturally resort in such cases, should be acquainted with the nature of the existing arrangements for recording the births, deaths, and marriages of Europeans in India, and for procuring certificates in proof of those events, in order that proper information on the subject may be given, when necessary, to the public.

I have therefore to request you to submit to the Secretary of State for India in Council, whether he will be pleased to direct that a list of the names of the officers charged with the duty of superintending the registration of these events may be furnished to me, together with any other information on the subject which he may see fit to place at my disposal.

I have, &c.

(Signed) GEORGE GRAHAM,
Registrar-General.

To the Under Secretary of State,
India Office.

Letter from the Under Secretary of State, India Office, to the Registrar-General.

SIR, India Office, 8th April 1867.

I AM directed by the Secretary of State for India in Council to acknowledge the receipt of your letter of 5th instant, and to acquaint you in reply, that the Official Agent to the Administrators-General has charge of all ecclesiastical registers, including those to which you refer, and that all written applications for certificates are acknowledged by a printed letter, a copy of which is enclosed.*

I have the honour to be,
Sir,
Your obedient servant,
J. COSMO MELVILL.

Major George Graham,
&c. &c. &c.

---

* India Office,
Westminster, S.W.,
18 .

I HAVE to acknowledge receipt of your letter
and to inform you in reply, that, prior to complying with your request, the fee of must be paid personally or by

according to the scale laid down by an Order of the Secretary of State for India in Council, dated 21st July 1862.

I am,
Your obedient servant,
M. HORNIDGE.

ISLANDS IN BRITISH SEAS.

JERSEY.—By an Act of the States of the Island, which was ratified by an Order in Council of the 27th April 1842, the registration of marriages, births, and deaths was established on the basis of the English Registration Act. A superintendent registrar (whose office is at St. Helier's) and subordinate registrars were appointed. Searches for entries may be made and certified copies obtained on payment of the following fees: for a general search 5*s*., for a special search 1*s*., and for a certified copy 2*s*. These regulations as to fees apply equally to all records of marriage, birth, or death, whether in the custody of the superintendent registrar, the registrars, rectors, vicars, or other persons.

GUERNSEY.—The ordinance of 24th October 1840 established a registration of marriages, births, and deaths conformably to the spirit and intention of the English law thereon. The chief registrar is required to provide indexes of the registers in his custody, and to allow searches to be made of such indexes and registers. For every search, together with a certified copy of an entry "if required at the same time," a fee of 1*s*. is payable.

ISLE OF MAN.—At a Tynwald Court, holden on 10th August 1847, three Acts were passed: (1) for the better regulating parish and other registers of baptisms, marriages, and burials; (2) to amend the law respecting the solemnization of marriages according to the rites of the Established Church; and (3) to provide for the solemnization of marriages of persons who object to and decline the offices of the Established Church. The provisions of these Acts are similar to those in force in England. In the Act for regulating parish registers it is provided that copies of the registers of baptisms, marriages, and burials shall be sent annually by the officiating ministers to the Episcopal Registrar, who shall cause them to be securely deposited and carefully arranged, and cause alphabetical lists to be made of the names of all persons mentioned therein, to be open to public search on payment of the usual fees.

By an Act of Tynwald, 10th August 1848, provision was made to enable persons who object to and decline the offices of the Established Church to cause registers to be made of births and marriages. Civil registry offices were established in Castletown, Douglas, Ramsay, and Peel, and four deputy registrars, under the supervision of a Registrar General, were appointed. Parents may give notice of births to the deputy registrar, who for the registry of a birth is entitled to have a fee of 6*d*. from the person requiring such birth to be registered, but if after 42 days following the birth and within six months, the fee of 5*s*. Deputy registrars are to allow searches in register books in their keeping, and to receive 1*s*. for every search extending over one year, and 6*d*. for every additional year; also 1*s*. for every certificate. Copies of all entries are to be sent quarterly to the Registrar General of the Island, who is to cause indexes to be made, to allow searches, and to issue certificates, receiving the same fees as the deputy registrar. The Act makes provision for registering dissenters' marriages but none for registering deaths.

ANNUAL ABSTRACTS

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

the Act of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1867.

† Where the parties to a marriage are of different religious persuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions; in these cases the two ceremonies are entered as two marriages. This column also includes 33 cases of marriage after divorce, viz., 21 *divorced men* who married spinsters, one *divorced man* who married a widow, 6 bachelors who married *divorced women*, and 5 widowers who married *divorced women*. For the districts in which these marriages took place see subsequent pages.

ABSTRACT OF MARRIAGES.—Marriages registered in England, pursuant to the

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

† Some of the births—especially of illegitimate children in London and large towns—escape registration.

* The *Districts* are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 641 in number, are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by *H* for Hospital or Infirmary, *L* for Lunatic Asylum, and *w* for Workhouse situated out of the District to which it belongs; and repetitions of these letters show the number of such Institutions in any District. The smaller Institutions are not noticed.

† For a table of the Deaths in the principal *Public Institutions* situated in the Districts of London *see* pages 83-4.

‡ Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.

* The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter *W* denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; *w* indicates that a Workhouse belonging to *another* District or Union is included; *H* indicates Hospital or Infirmary; and *L* Lunatic Asylum.

† For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.

‡ Wherever the minus sign (−) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated. The Excess of *Deaths* over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 114 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a *few persons*, or *diseases* which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Where it is desired,

(*continued at page* 128.)

CAUSES of DEATH at different Periods of Life, in the Year 1867.

partial correction, however, can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as chicken-pox, mumps, epistaxis, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120–125.]

*NOTE.—In calculating the average annual rate of mortality from all causes in London, a correction has been made by distributing the deaths in *hospitals* proportionally over every district. The second rate of mortality (in figures of different character) is the result of a further correction,—in Chelsea and Greenwich for the Military and Naval Hospitals, in Wandsworth for the County Lunatic Asylum, and in the other London Districts for Workhouses situated out of the Districts to which they belong.

In all the other Districts of England the second rate of mortality is the result of a correction for either a Naval or Military Hospital or Camp, a County Lunatic Asylum or a Workhouse situated out of the District to which it belongs. The particulars of these corrections are given in the Supplement to the 25th Report, pp. xl-lviii.

Population 1861, Average Annual Rate of Mortality from All Causes in the Ten Years 1851-60, and Deaths from several Causes in the Year 1867, in the DISTRICTS of England—*continued.*

II.—SOUTH EASTERN COUNTIES—*continued.*

* The mortality for Pontypridd is returned with Cardiff and Merthyr Tydfil.

CHANGES in the CONSTITUTION of DISTRICTS during the Year 1867.

[The Name of the District is in SMALL CAPITALS, that of the Subdistrict in *Italics*. The Figures (in parentheses) in Cols. 1. and 4. show the number of the District.]

Superintendent Registrar's DISTRICT and Registrar's *Subdistrict* from which a Transference was made.	Date of Change.	Place and Population (1861) transferred from the District in Column 1 to the District in Column 4.	Superintendent Registrar's DISTRICT and Registrar's *Subdistrict* to which an addition was made.
NORTHWICH (456); *Middlewich*	8th March -	Goostrey-with-Barnshaw - 268	CONGLETON (457); *Church Hulme.*

NOTE.—In the various Tables of Abstracts given in this Report, the Area and Population are stated for the above Districts and Sub-districts according to the alterations here indicated.

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in ENGLAND in 1867, by WILLIAM FARR, Esq., M.D., F.R.S., D.C.L. . . .	207—226
TABLES	227—248

Letter to the Registrar General on the Causes of Death in England, by William Farr, Esq., M.D., F.R.S.

Year 1867.

Sir,

Epidemic cholera ended last year, and left few traces of its existence except in London, Liverpool, and Durham. Diarrhœa, upon the other hand, was very frequent and fatal all over the face of the country, except in Wales and some of the mountainous regions supplied with pure water.

The rate of mortality, as shown in your report, differed little from the average; but in general the mortality of children was lower, of people of advanced ages higher, than the average of 30 years. The cold weather of January was exceedingly fatal to the aged. On the night of January 5–6 the thermometer at Greenwich fell to 14° centigrade below the freezing point of water,* and the deaths in London alone registered during the subsequent week suddenly rose to 1891. The excess was 385 deaths over the deaths of the same week of the year before, and of that excess 395 occurred in people above the age of 40. The same chill frost extinguished thousands of lives in other parts of the kingdom, where it penetrated the hut on the mountain side, the cottage in the valley, and here and there the mansion in the ancestral park.

What are Causes of Death.

The human organism, although the force with which it is animated is indestructible, dies inevitably under a great variety of conditions. In one instance death is the direct effect of mechanical violence; a mere shock of arrested motion converts the life force into a new form: in another instance blood is lost and the processes of nutrition are stayed: then agents like fire or frost disintegrate the parts, or chemical forces like opium still for ever the living action in sleep. Submersion under water or stoppage of the air-ways shuts out oxygen, and with the cessation of the supply of this element life is extinguished as suddenly as the light of a lamp; so also life slowly goes out when the supply of food is insufficient, as the flame of a lamp dies when oil is withheld.

Adverse living molecular forms too assert their powers over the structure, and, as in small-pox, syphilis, glanders, cholera, and the other zymotic diseases, transform the body into their own substance and habitation, so that it can live no longer its own life, but is transformed first into multitudes of organic particles, and then mayhap, after many transmutations, into air, water, and earth. What was a living nature of the highest form becomes a dull cloud of matter, again after cycles of changes to be incarnated.

The constitution of the tissues undergoes transformations in cancer and tubercle and other analogous diseases as the blood does apparently in diabetes.

The most common form of disease is inflammation and its results in the several organs of which the body is a confederation; and upon taking up these organs singly each is found to have its well characterized diseases: the brain, no longer the seat of intelligence, sensibility, and reason, becomes the seat of madness; the heart loses its wonderful hydraulic precision; the

* It was 6°·6 of Fahrenheit, which has its zero 32° of its own scale below the freezing point of water.

lungs neither drink up nor discharge breath; the stomach transmutes its aliments no longer or transmutes them amiss; the liver and the kidneys fail to supply their specific distillations; the joints decay; the muscular system, once finely adjusted in its movements, is paralysed; the skin loses its fresh colour, and changes into ulcer and leprosy. The formative forces in some cases go wrong, or stop and leave organs unfinished. The reproductive system, too, which creates and perpetuates generations in endless succession, itself kills the parent and the child in one flood,—one throe of agony.

Now, when it is considered how multitudinous and complex the causes are, not of the one phenomenon, but of the many phenomena of death, for death has its many phases as well as life, it can scarcely be surprising to find that out of nearly half a million of deaths no causes were assigned in eight thousand or more instances. In 4630 cases no causes were specified; in 3506 cases it is only inferred that the deaths were sudden, as in them inquests were usually held.

Through the cooperation of the medical practitioners of England and Wales the majority of cases are certified on forms supplied by the Registrar General. In London about 93 per cent. of the deaths are certified, as far as the causes are concerned, by the medical attendants, 5 by the coroners, leaving only 2 in 100 uncertified. Out of 1578 deaths in London recently analysed 26 were uncertified, of which 4 only are recorded where the deceased had no medical attendant. One of the counties, Northampton, taken at hazard, yielded this result: out of every 100 deaths 91 were certified, 7 were uncertified; 2 died without medical attendance. In some few counties many of the people get no qualified medical advice during life, the medical man lives at great distances, or the people, ignorant themselves, apply for relief to irregular practitioners, men sometimes of natural ability, but often possessing no claim to confidence, except that founded on boundless faith in their own nostrums, which perform the same amazing miracles now as were performed in the dark ages by relics, charms, and exorcisms.

It must be stated, moreover, that the causes of death assigned are often inadequate, and frequently erroneous. A person is dead. What was the cause of his death? is the question addressed to the medical attendant. He has all the information to guide him in his answer that he employed during life in the treatment; but that may be insufficient. Some few years ago "dropsy" would have been returned, and was accepted in medical science as a disease, a cause of death. It is still used rightly in some cases. But many cases are traced back further; the dropsy is found (1) to be associated with albuminous urine, and affections of the kidney, such as Bright's disease; or (2) it is the result of retarded circulation from organic disease of the heart; or (3) it is *ascites*, an effusion into the peritoneal sac from obstructed circulation through the liver; or (4) it is hydrocele, perhaps from injury; or (5) it is ovarian dropsy; or (6) it is a consequence of scarlet fever; or (7) it is anæmic; or (8) it comes on suddenly with fever; or (9) it is general and associated with scurvy. Now after the first step is made in defining the seat and source of the "dropsy" we have got at one link of the chain of causes. The dropsy of scurvy, or anæmia, may be traced to famine, or to insufficiency of some elements of diet; that cause is primary. Then the scarlet fever is the cause of the dropsy; but what is the cause of the first disease? how was the dead child infected? Ascites, the cirrhosis of the liver, may be traced to alcoholism as its primary cause; or the heart disease may be derived from rheumatic fever. And the rheumatic fever may be the result of exposure to malaria of a specific kind. Now in many cases the primary cause can, but in many cases it cannot, be discovered. Yet to be able to prevent death, the primary cause is of first importance, as it sets the rest in motion.

There are affections of the brain, of the chest, and of other internal parts, which can be distinguished by the pathologist on actual inspection, but not otherwise; while other fatal functional derangements cannot, under the most favourable conditions, in some cases, be connected with any changes in the material structure of organs, even with the help of the best available instruments.

Observers, with excellent intentions, are not always competent, or do not devote the required time to their investigations. Their means of observation are sometimes restricted; they only see the patient for a few moments in his last hours, or for a few minutes at a public dispensary; while from children the subjective symptoms cannot be gathered.

Where the organic injury is evident in the dead body, and is the proximate cause of death, the inquiry after the first cause only commences. Thus a man is found dead in the road in blood, with a wound through his head; that was lethal; but with what instrument was the wound inflicted? A pistol. Who fired the pistol? The man now dead, or another man? Himself. Then was it an accident or a suicide? What were the motives of suicide? Another man. Is the manslayer a soldier fighting, or a duellist? or is he guilty of murder, manslaughter, or justifiable homicide? In a railway accident the question "who is to blame?" involves "what was the cause," what were the circumstances of the overthrow or collision?

On inquiries into the causes of this class the great tribunals of European justice are occupied. To these causes of death by the violence or malice or recklessness of men importance is everywhere attached. But the causes of the whole deaths of a nation partially inquired into everywhere have nowhere been published, except in England. Your returns are at present, it is to be regretted, unique. And while they are avowedly incomplete, as the chain of causes is not always traced, and the true cause is sometimes mistaken, I hope to be able to show that the returns are of use in their imperfect state, that they require improvement in the present day, and that they are of incalculable interest to mankind.

It is true that 48,634 persons died at the age of 75 and upwards in the year, and thus attained advanced ages; 650 lived to the age of 95 and upwards; of whom 70 lived a hundred years and upwards, which is the term of human life. But how fared it with the multitude? 134,187 persons died in ripe manhood at the age of 25 and under 65 years; while 242,325, under the age of 25, were cut off and perished in childhood and youth! Of the total recorded deaths only 392 were referred to homicide; and paramountly important as the deaths from this cause unquestionably are, occupying too so large a portion of our juridical force, and testifying as the reduced number does to law and police efficiency, it brings out with still greater force the magnitude of the sacrifices of life from other agencies. What these agencies are is assuredly well worth careful inquiry. Death is inevitable, but why is life cut short? Why do the people of England live only a mean lifetime of 41 years?

Biology includes in its sphere of research death, which like birth is common to man and to every living thing; so the extension of that science will shed light on the causes of death. The laws of life involve the laws of death; and every forward step of the biologist will open new fields in vital statistics. In the meantime the existing knowledge admits of so many practicable applications as to justify us in asking for its extension by all the means of accurate observation. It places at the disposal of men now an incalculable control over the duration and happiness of their lives: and it opens to the future a prospect of discovering not indeed elixirs of life, not secrets of earthly immortality to any individual, but protection against many of the dangers which beset the human race.

Science will naturally advance, and the extension of skilful practitioners to the remoter parts of the country will supply good observers. To them we must trust. Where death happens in such circumstances as render it impossible to obtain a satisfactory certificate from a medical man in attendance, the cause, I submit, in the interests of science and of human safety should be investigated by a medical officer specially appointed in each registration district.*

One important step has been taken by a committee nominated by the Royal College of Physicians, who have drawn up a complete nomenclature of the pathological causes of death. This will be distributed among the practitioners of the United Kingdom, and will thus facilitate the identification of that great class of causes. Synonymes are given in the Latin, French, Italian, and German languages.

Progress of Public Health possible.

Malthus maintained at one time that attempts to prevent the ravages of epidemical diseases are hopeless, inasmuch as the population always presses on the means of subsistence. Now population is dependent on two factors, the yearly births of children and the number of years the children live; and if subsistence is limited population is also limited. The population of England may be less, but can never be greater, than the subsistence it can command. It is not, however, necessary that the subsistence itself should be produced in England: other products of the same exchangeable value can in the present state of transport in the world always be converted into subsistence. Manchester lives as well as a county consisting of farmers and agricultural labourers. A nation then is not "cabined, cribbed, confined" by its acres; it can create on one acre of land produce worth the agricultural products of a thousand acres. Subsistence is a limited but not a fixed quantity. Its extension may keep pace with the extension of population. Then the births of the present day suffice to sustain a population much larger than the population existing; and yet the births might be increased by one third, as will be evident when it is considered that more than two million women of the age of 15—55 are unmarried, and that the three million women of that age married, "or otherwise to the same extent as married women bearing children," bear on an average only 22 children annually to every 100 women.† The reproductive power of the nation is thus under "restraint," as Mr. Malthus called it, and the experience of France implies that without diminishing the number of persons in the married state the annual births may here fall very considerably below the present numbers. Then there is the great opening of emigration. Vast regions of America, Australia, Asia, and Africa are unpeopled, or are peopled by unsettled unproductive savages. Colonial settlements,—plantations, as Bacon called them,—are the glory of England. Other races have transiently conquered the nations of the earth; England has planted Englishmen on continents from which time cannot dislodge them. These plantations call perpetually for recruits.

To dread, therefore, any ill consequences from arresting epidemics, or to argue on *a priori* grounds that it is impossible in opposition to nature to save life, to prolong life, to strengthen, and in every respect to improve the English race, is illogical; for give them health, and if the increased numbers cannot be sustained on subsistence by their industry within the shores of those islands, the births will naturally decline; but the natural remedies are increased industry to command produce from abroad, and emigration to seek after subsistence on the vast trans-oceanic territories.

Then the very conditions which diminish the numbers killed in the battle of life diminish the numbers wounded; and as every single death

* See 27th Annual Report of Reg. Gen., App.

† See Census Reports, Vol. II. pp. xxii and xxiv, and Vol. III. p. 21.

by violence implies the injury or mutilation of survivors, so nearly all the zymotic diseases leave irreparable traces in the blind, the deaf, the weak in body or brain. By removing the discovered causes of death you at the same time remove conditions which prevent the progress towards perfection of the English race. We have, therefore, everything to hope, and nothing to dread from measures of public health and of public safety.

I. Zymotic Diseases.

There are four orders in this class, which includes the whole series of epidemic, endemic, and contagious diseases. The miasmatic order (1) includes fevers and all the diseases affecting man by specific matters through air and water; scarlatina and ague are types of its two sections. Small-pox connects this order with (2), enthetic affections, such as syphilis and glanders, which are propagated by inoculation.

(3) The dietic order includes, as causes of death, whatever is the direct result either of the want of the natural elements of food, or of the consumption as diet of noxious matters. Famine, scurvy, want of breast milk, alcoholism are types. (4) Parasitic diseases differ from those of the two first orders, inasmuch as the organisms which give rise to them have a well defined, independent existence, and a distinct place in the animal and vegetable kingdom; their propagation has many points of analogy with the action of molecular multiplication in zymoses. Trichina, tænia, (tape-worm), acarus scabiei (itch), oidium albicans (thrush), sarcina ventriculi are types of 55 parasites giving rise to diseases.*

This class of diseases was fatal to 90,989 persons. It occasioned 20 in every 100 deaths, and the deaths to the population were in the proportion of 4·288 deaths to 1000 persons living. The mortality of zymotic diseases, except in 1860, has never in any year since 1851 been lower. 1860 was a year of exceptionally low temperature, and of abundant rainfall. In the present year the temperature was also below, and the rainfall was above the average. The year 1867 also followed an epidemic year, and as a general rule the deaths in years after epidemic years fall below the standard. The cholera, which to every 1,000,000 living was fatal to 685 in 1866, was fatal to only 43 in 1867; the deaths from diarrhœa in the same number rose from 818 to 937; the mortality from almost every other disease, except diarrhœa, subsided (Table 12). Comparing the deaths to a million living in the three quinquenniads (1850–64), deaths from small-pox fell from 279 to 191; deaths by measles rose from 406 to 478: by scarlatina and diphtheria the deaths rose from 891 to 1190; by croup from 225 to 279; by whooping-cough from 497 to 527. The increase by these causes in the fifteen years did much more than countervail the decrease in the deaths from small-pox. Diarrhœa and cholera in the two years, 1865 and 1866, sustained the high mortality. In 1867 there was, notwithstanding eruptions of some forms, a decisive fall of zymotic activity; even fever declined. The storm was followed by a calm.

Several of the zymotic diseases, as a rule, only occur once in life, and they attack the young, following each other as age advances in a certain order of developed intensity. Thus whooping-cough is most fatal in the first year of age, so is diarrhœa; measles is most lethal in the second year, croup in the second year, diphtheria in the second year, searlatina in the third year or the fourth. Then few deaths from whooping-cough, few from measles happen after childhood; none from croup. Few deaths from these causes occur past five years of age. Afterwards scarlatina and diphtheria overtake the young travellers in life, and slay one-third of their victims. Vaccination interferes with small-pox, which is fatal to nearly equal numbers over and under five years of age; for many adults still die of small-pox.

* In Nomenclature of Diseases, prepared by College of Physicians, pp. 232–235, fifty-five human parasites are enumerated. See Sir H. Holland on Hypothesis of Insect Life as a cause of Disease, in Med. Notes and Reflections, p. 567.

Fever, erysipelas, carbuncle, influenza, dysentery, ague, rheumatism, and puerperal fever (metria), are most fatal to adults.

To prevent the ravages of these causes we have to go beyond their pathological phenomena; and it must be recollected that every death represents several occurrent cases, varying with age, with hygienic condition, and with medical treatment. The exact determination of the factors of mortality in the several types of disease lies at the foundation of therapeutics, yet it has been strangely neglected. The new Clinical Society might well take this in hand. To illustrate what is here meant Dr. Murchison shows that in the ten years, 1848–57, at the London Fever Hospital the mortality of cases of continued fever was at the rate of 10 per cent. at the age of 15–25, and 15 per cent. at the age of 25–35; so to 10 and to 15 deaths at the two ages there were 100 cases of fever. Proceeding further in the analysis of the three forms of such fever he shows that the mortality from typhus at the same two ages is 7 and 16, from enteric fever 18 and 22, from relapsing fever next to nothing. That is in the London Fever Hospital.* The rates vary in private houses according to the condition of those houses; and we may assume that the danger varies under different lines of medical treatment. Here is a wide field for interfering with the operation of pathological causes of death. It is the great function of the medical profession. They arrest, they render less lethal, zymotic diseases, by drugs, diet, and hygienic regulation. The force Physic has at its command is undetermined, but it will increase as the science and the art increase, and as the distribution and the organization of the profession are improved.

Intermittent and remittent fevers are known to be generally induced by marshes. Dr. Salisbury endeavours to trace ague to the pollen of a palmella. Whatever the direct agent may be we know that the danger from these diseases is obviated in two ways; (1) by avoiding marshy tracts altogether, and (2) by draining and converting the marshes into cultivated land, as has been done partially in England. On the undrained lands of the lower valleys of the Thames, and of other English rivers, where their waters are slow, sluggish, thrown out of their channels by milldams, thousands of the population suffer from ague, rheumatism, and neuralgia, while many die of these and of other diseases. Drainage of the marsh land, removal of obstructions to rivers, and engineering improvements of the water channels will obliterate countless evils.

The mere aggregation of people together in close apartments generates or diffuses the zymotic matter. Thus, place lying-in women in close proximity to each other, or mix them up with the patients of a general hospital and they die of puerperal fever; place many wounded men in a ward where cleanliness is neglected, and erysipelas, pyæmia, gangrene spring up; imprison men within narrow walls, or crowd them in rooms and typhus breaks out. The general and special hospitals of the country have been, until quite recently, erected without any special reference to the dangers accruing from the assemblage of great masses of sick people within the walls of one building, so that the efforts of the most skilful medical officers are frequently defeated; but a better system of hospital construction, with more cubic space, is likely to prevail, with due provision for effective changes of air, and then the evils of agglomeration will be mitigated. It is only recently that the subject has attracted the attention of surgeons,† who will no doubt anxiously watch the results of

---

* Murchison on Fever, pp. 221, 369, and 531.

† Sir Astley Cooper, in his lectures as reported in the Lancet, refers to cold and other causes of gangrene, but has no reference, as far as I can find, to its origin in the poison of hospitals. Under erysipelas this passage occurs: "In hospital practice surgeons were "formerly exceedingly afraid to operate in autumn and spring, for it has often happened "that the *stimulating effects of adhesive plaster* have produced this disease, and have led to "the death of the patient. Sometimes it is epidemic and sometimes contagious." *Lancet*, Vols. I., II., edited by T. Wakley, surgeon, 1826, p. 247. Pyæmia is not referred to specifically by the great surgeon.

the new arrangements. Sir Henry Thomson and Sir James Simpson will, we may hope, continue their researches so as to determine accurately the mortality after the various kinds of amputation in hospitals and in private houses.

To limit the operation of zymotic diseases overcrowding in towns must be absolutely prohibited: the mere accumulation of masses of living people within narrow limits either generates or insures the diffusion of epidemic disease. The plague which almost destroyed Athens was aggravated by the policy of Pericles when he brought the outlying country population within the walls. It is now as then a conflict of difficulties; for the question arises, where can the people live if you turn them out of cellars or garrets; and the alternative is in appearance cruel. But as a healthy city of a limited number of inhabitants enjoys life and fulfils the destiny of its race, while a crowded, suffering, sickly, degenerated city of twice the population only drags on a wretched existence in violation of the principles of life and the operations of nature, laws against over-crowding must be rigorously enforced. A wise humanity involving self-preservation is the law of every city.

Small-pox.

To render the body insusceptible of one zymotic disease of a disfiguring and distressing nature is in itself a good thing, and there is no evidence to show, nor is it likely, that pure vaccine lymph induces any other disease than cowpox. The number of deaths after vaccination is inconsiderable. It bears no comparison with the number of deaths by natural small-pox. And the opposition to vaccination on any of these grounds is irrational.

It is, however, by no means proved, that the general mortality under unfavourable sanitary conditions is much reduced by rendering a child insusceptible of one type, while he remains exposed to all other types of zymotic disease. This was clearly pointed out in a remarkable treatise by Dr. Robert Watt, lecturer on the theory and practice of medicine in Glasgow. The work was dedicated to Sir Gilbert Blane. Dr. Watt found that, in accordance with his own experience, the Glasgow burial registers showed a decisive decline of the deaths by small-pox after the introduction of vaccination. His researches extended over the 30 years 1783–1812,* which he divided into *five* equal periods of six years each. In the first three periods (1783–1800), before "vaccination could have had any influence," the deaths by small-pox in 100 deaths from all causes were 20, 18, 19; in the fourth period (1801–6), vaccination had nearly reached its maximum, and the deaths by small-pox fell to 9; in the fifth period (1807–12), when vaccination had "been pretty fully established, "perhaps as much so as in any other city in the empire," the proportion fell to 4. This gratifying result was to some extent counterbalanced by a slight increase in the proportion of deaths by whooping-cough, and a great increase in the deaths by measles. What was still more strange, Dr. Watt found that the proportion of deaths under 10 years of age, to the deaths at all ages, was rather greater in the last than in the first 6 years. He does "not see the smallest ground for the hypothesis that "vaccination does positive harm" "by infusing some peccant . . . . humor "into the constitution." But in the first period, "when a third of all the "deaths under 5 years of age were caused by small-pox," a child had the best chance of reaching its tenth year. Dr. Watt was far from expecting this result. He had found that "more than 50 per cent. of the "human species died before they were 10 years of age," and that 20 out of 100 born, excluding still-born, "perished by this dreadful malady."†

* Appendix to Treatise on Chincough, by Robert Watt, M.D. (1813), pp. 375–379.

† Dr. Watt describes vividly his astonishment, pp. 334–336:—

"I began to reflect how different the case must be now! In eight years little more than 600 had died of the small-pox; whereas in 1784 the deaths by that disease alone

This is an important point in pathology; and it must be admitted that although there were defects in his data Dr. Watt succeeds in showing (1) that small-pox was one of the great causes of death in Glasgow down to the year 1800, (2) that the deaths by small-pox were reduced to a fifth of their original number by vaccination, and (3) that the children died in nearly the same numbers as before, but of other forms of disease.

Glasgow was then rapidly increasing, and it is possible that the births were then increasing; the mortality is therefore less than it appears to be by Dr. Watt's method. But this does not invalidate his induction. Glasgow has always been famous for its statistics, and these unfortunately show an increase of the mortality of children. Thus in the five years 1821–5 the mortality of boys under five years of age was 8·08, in 1831–5 it was* 9·78. In the year 1865 the mortality of boys in Glasgow was 11·48, of girls 10·36.† These recent returns confirm the principle. Small-pox is no longer so fatal as it was before vaccination was introduced; in Glasgow it caused in the year 1864 no longer 20 but 2 in 100 deaths; only 180 in 6054 deaths, that is 3 per cent. of the deaths under 5 years of age; yet the mortality of children is certainly as high, probably higher, than it was in the last 18 years of the last century.

The compulsory vaccination in England has reduced further the fatality of small-pox, but since 1853 other diseases have so prevailed as to counterbalance the gain under this head. The mortality of children has not declined in a corresponding degree.

It is singular that Dr. Watt, evidently a practitioner of great sagacity, and a philosophical professor of medicine, does not at all advert to the wretched sanitary condition in which the increasing population of Glasgow lived at the time he was writing. Yet a part of Glasgow, so late as 1841, is thus described by M'Culloch.‡ "It consists of a labyrinth of "narrow lanes or wynds, whence numberless entrances lead off to small "squares, courts, or closes, which usually have a dunghill [human] in the "centre. These wynds and courts are formed of old, ill-ventilated, and "mostly dilapidated houses, varying from two to four stories in height, "without water, and let out in stories or flats; one of the latter often "serving for the residence of two or three families. Frequently, however, "the flats are let out in lodgings, as many as 15 or 20 individuals being "occasionally found huddled together in a single room . . . . Filth, desti-"tution, and misery prevail to a frightful extent." I cite this passage to

---

amounted to 425, and in 1791 to 607, which on both occasions exceeded the fourth of the whole deaths in the year.

"To ascertain the real amount of this saving of infantile life, I turned up one of the later years, and by accident that of 1808, when to my utter astonishment, I found that still a half or more than a half perished before the tenth year of their age! I could hardly believe the testimony of my senses, and therefore began to turn up other years, when I found that in all of them the proportion was less than in 1808; but still in taking an average of several years, it amounted to nearly the same thing as at any former period during the last 30 years. This was a discovery I by no means expected, and how it could have come to pass appeared to me inexplicable.

"From every circumstance which had come under my observation, the efficacy of vaccine inoculation appeared certain. The experience of 13 years' pretty extensive practice had confirmed me fully in this opinion. But still the question recurred, how are we to account for the same or nearly the same number of deaths under 10 years of age? As no new disease has appeared, the deficiency occasioned by the want of the small-pox must have been made up by a greater mortality among the other diseases of children. Has it been equally divided among them, or has a greater share fallen to some than to others?" ["An inquiry into the relative mortality of the principal diseases of children in Glasgow. Appendix to Treatise on Chincough, pp. 334–336. By Robert Watt, M.D. (1813)."]

* M'Culloch; Statistics of British Empire, Vol. II. p. 547. Lancet, 1835–6, No. 12., paper by Mr. Edmonds.

† Report by Dr. Stark, F.R.S.E., 10th Report of Registrar General of Scotland, p. xxxiv.

‡ Geographical Dictionary, Vol. I, pp. 904–5, Art. Glasgow.

show under what circumstances the suppression of a most fatal type of disease did not diminish the mortality in Glasgow. And it is under unfavourable conditions of the same kind, although less in degree, that the mortality is now sustained in England, where the town populations constantly increasing, without equivalent arrangements for drainage and for accommodation in dwellings, are every year exposed to increasing dangers.

There are two diseases, scarlatina, and diphtheria itself a new type of disease, which have been exceedingly fatal since the year 1855, when diphtheria was first distinguished in the returns. Up to 1857 it was apparently confounded with cynanche maligna; but in 1858 it became popular, and in that year 4836 deaths, in 1859 no less than 9587 deaths, were ascribed to diphtheria. In 1858 and 1859 the deaths from scarlatina and diphtheria together were 30,317 and 29,494; in the two years 1863–4 the deaths from the same causes rose to 36,982 and 35,164. The mortality in 1858–9, from small-pox, had fallen to 3·35 and 1·97 annually in 10,000 living, while from scarlatina and diphtheria the mortality had risen in the two years to 15·72 and 15·13. In 1863–4 the mortality from small-pox was 2·93 and 3·73, from scarlatina and diphtheria 18·18 and 17·08.* While small-pox dwindled, these two zymotic diseases flourished at the expense of the growing population.

Small-pox, as a general rule, occurs only once in life; some children enjoy immunity against attack; they cannot be vaccinated, they cannot be inoculated; others are infected by the slightest exposure; and under infection some take the disease slightly, some malignantly, fatally. So it is with scarlatina, which now sweeps away a family of children, and is then slight or even unperceived in other families during the same epidemic; epidemics, however, varying in intensity and character from time to time, from place to place.†

It is impossible, in the present state of science, to reduce under any simple law the phenomena of disease development; but disease development is evidently associated with the life development of species, and has with it some analogies. It is, for instance, found by the English Life Table that of 1000 children born alive, 703 live to the end of the tenth year, 297 die in the 10 years of current life; and the deaths, frequent at first, become less frequent as the age of puberty is approached. The deaths run down rapidly from 149 in the first year to 5 in the tenth year of life; and they are the results of many types of disease, springing up in a certain order. The rate of death is, under the same conditions over a series of years, nearly constant. There is a determinable law of morbility, as there is a determined law of mortality.

While the living units of the generation have fallen in the proportion of three tenths, their constituent elements have augmented by growth: thus while, according to the determinations of M. Quetelet, the weight of 703 children of the age of 10 years is 17,702 kilograms,‡ the weight of 1000 children at birth is only 3055 kilograms; and going back to the ova, of which 1,000,000 would not be of the bulk of a cubic inch, or still further to their germ cells and sperm cells, which are microscopic points, we arrive at the elementary units of which these 1000 live-born children are the survivors. The embryo in its development is subject to casualties which probably increase as we approach its origin. But with this we have nothing to do. It contains in little elements which it has derived from both its parents, and which will or

* See Tables, pp. 234–9.

† Sydenham describes simple scarlatina distinctly: he does not refer to the throat affections, and says the patient can only die by the doctor's default. Joseph Frank describes the disease now as the most dreadful scourge in Europe. *See* Maladies éteintes et maladies nouvelles par C. Anglada, 1869, pp. 304–50.

‡ Quetelet sur l'homme, Vol. II. p. 37, 1 kilogram = 2·2 lbs. avoirdupois.

may reproduce their nature, the nature of their ancestors, and what is more immediately to our present purpose, the diseases by which they perished. To explain various phenomena in reproduction hitherto inexplicable, Mr. Darwin advances the theory of Pangenesis, in which he assumes that all the organs of the parents are represented by gemmules in the embryo.* It is a species of atomic theory in biology. Adopting the hypothesis for the moment, let us suppose that certain gemmules or corpuscles, or "germinal matters," are in the system of a child, capable of becoming the small-pox "granulations" of Chaveau, alone or after coalescence with the granulations of a small-pox patient, then it is conceivable that their metamorphosis, having exhausted the material, may leave the system insusceptible of any further invasion. The same reasoning will apply to measles, scarlatina, typhus, and other types of disease not recurrent.†

The human frame is built up of molecules passing through the evolutions which constitute the various phases of human life. But these molecules are completely deranged by other molecules of lower forms of life, such as the small-pox "granulations," *variolads* as they may be named, which convert variable quantities of the substance of the child's body into their forms, to be finally transformed into pus or into other corpuscles according as the child's life survives or succumbs in the struggle. Each zymotic disease is generated, we may conceive, by species of living molecules, which may be of a twofold nature, bearing some such relation to each other as the germ and sperm plasms of plants and animals, and becoming proliferous after coalescence, give rise to the various forms of epidemic disease. The danger of bringing great numbers of people into close proximity is well known; it evidently increases the chances of the coalescence, propagation, and diffusion of the various active disease molecules.

The life of these zymotic generations is the death of the elemental part of the human organism, and yet their development depends on its existence. This to some extent limits epidemics. The black death destroyed according to some accounts half the population of England; and the very force of its zymotic principle destroyed the pasture on which the death fed;

---

* Animals and Plants under Domestication. Darwin, Vol. II., pp. 357–404.

† Mr. Darwin gives a correct and succinct account of the current doctrine of the functional independence of the elements of the body :—

"Physiologists agree that the whole organism consists of a multitude of elemental parts, which are to a great extent independent of each other. Each organ, says Claude Bernard, has its proper life, its autonomy; it can develop and reproduce itself independently of the adjoining tissues. The great German authority, Virchow, asserts still more emphatically that each system, as the nervous or osseous system, or the blood, consists of an 'enormous mass of minute centres of action . . . . Every element 'has its own special action, and even though it derive its stimulus to activity from other 'parts, yet alone effects the actual performance of its duties . . . . Every single 'epithelial and muscular fibre-cell leads a sort of parasitical existence in relation to the 'rest of the body . . . . Every single bone-corpuscle really possesses conditions of 'nutrition peculiar to itself.' Each element, as Mr. Paget remarks, lives its appointed time, and then dies, and after being cast off or absorbed, is replaced * * * Whether each of the innumerable autonomous elements of the body is a cell or the modified product of a cell, is a more doubtful question, even if so wide a definition be given to the term, as to include cell-like bodies without walls and without nuclei. * * * * * Physiologists maintain, as we have seen, that each cell, though to a large extent dependent on others, is likewise, to a certain extent, independent or autonomous. I go one small step further, and assume that each cell casts off a free gemmule, which is capable of reproducing a similar cell. * * An atom of small-pox matter, so minute as to be borne by the wind, must multiply itself many thousandfold in a person thus inoculated. It has recently been ascertained that a minute portion of the mucous discharge from an animal affected with rinderpest, if placed in the blood of a healthy ox, increases so fast that in a short space of time 'the whole mass of blood, weighing many 'pounds, is infected, and every small particle of that blood contains enough poison to 'give, within less than 48 hours, the disease to another animal.'" [Animals and Plants under Domestication. By C. Darwin, M.A., F.R.S. Vol. II. pp. 368–9–70–77–78.

it put an end to a mass of the people living; and to this extent at least it diminished its own mass; it burnt up in a few years its elements in those surviving; and it encountered other organizations, whose career it could not arrest. So every year recent epidemics subside on this ground; or they are limited by the operation of conflicting disease molecules. For if there is a struggle for existence among the visible forms of life, and if the struggle is the severer, the nearer these forms are allied, is there not also the same struggle among the elementary independent particles of life, to which epidemics are due? Theirs is also a struggle for subsistence.*

The constituent units of the body, however independent they may be in their action, are not independent in the same sense as infusorial units, but form parts of one whole, of one *microcosm*, on whose life they depend. As the one may be called the corpuscular life the other may be called the cosmical life of the species: and each species has conditions favourable to its own existence, unfavourable to other existences; alter these conditions essentially, and the life of a given species, gains or loses its ascendency; the matter of which it disposed, no longer employed in its further development towards perfection, is abstracted and appropriated by other forms of life. The Glasgow victims were gathered together from all quarters, from the Highlands, from Ireland, and from elsewhere; they were lodged in conditions unsuitable to human life; but excessively favourable to the generation of disease molecules, which abounded in the air, water, and food, as well as in their own structures. To render them unassailable by *variolads*—the matter of small-pox—was not enough, for it left them exposed to the other forms of disease. Thus in a garden where the flowers are neglected, to keep off thistle-down merely leaves the ground open to the world of surrounding weeds.

The spread of small-pox, scarlet fever, and diseases of that kind is analogous to many chemical and natural phenomena. Thus a spark falls, the fire spreads, and a city is in flames. The process of combustion, like a plague, is propagated. Atoms of hydrogen and oxygen combine the instant they touch a kindred flame, and combustion goes on self-sustained so long as those elements are supplied. Water is the product. But the flame may be kindled by other elements in combustion; and water will not generate water; not so with fermentation. A little leaven leavens the whole lump; and the leaven left propagates other leaven. Yeast in wort converts its sugar into alcohol; wines ferment and undergo various changes; so do milk, butter, cheese, and other animal products; each fermentation has at least one specific chemical product, be it alcohol, acetic acid, lactic acid, or butyric acid; and also one ferment. It is the great merit of Pasteur to have established by ingenious and experimental research, that all these ferments consist of organic molecules, propagated from previous molecules of the same kind. He has shown not that spontaneous generation is impossible, on the confines of the three kingdoms, under every possible condition, but that the fermentations in all the cases he examined were set in motion by specific pre-existing germs; multiplying indefinitely by reproduction under given conditions.

Through self-propagating chemical action, as instanced in combustion, we enter the region of fermentations, where there is also chemical combination, but in dependence on the action of living corpuscles on lifeless matter of organic origin.

Again, we find living molecules in living animals inducing series of changes in the cosmical life, as for example in the ox or in the silkworm.† This differs from fermentation; it is a case of strange corpuscles at work

* Thucydides notices that during the plague of Athens other diseases declined: "And "besides this, none of those diseases to which they were accustomed afflicted them at "that time; or whatever there was ended in this." Hist. L. II. 51. He refers to this twice, and it has been since matter of common observation.

† See Pasteur on Silkworm disease.

in the midst of the constituent corpuscles of a living being. The struggle and the reaction of the conflicting elements produce the phenomena of diseases, such as small-pox. Granules of vaccine lymph, for example, inserted in the arm of a child, give rise to heat, swelling, redness, pustules, maturation, cicatrix; in cows they produce a disease of another form, cow-pox; in horses they give rise to grease. The corpuscles are specific in their nature, as is shown by the reactions, nearly uniform, which follow in the same animals; reproducing themselves in the same structures; and giving rise to indelible modifications of the corpuscles (biads) of which individuals affected are built up. The diseases of this nature are called zymotic diseases; the peculiar processes zymoses; to distinguish them from fermentations, with which they have more points of contact than they have with combustion, or any common propagated chemical action. This class of diseases may be designated by a letter; or by an arbitrary word invented for the purpose; and so may the process; but it is quite in accordance with English practice to designate a class of phenomena by a name derived from the Greek, without thereby implying that the new name is either limited or defined by the Greek root.*

Each disease has its peculiar germinal matter; which can sometimes be isolated, as in the case of small-pox, cow-pox, syphilis, glanders, purulent ophthalmia, cholera; while in other cases, as in influenza, its existence is assumed by analogy and hypothesis. It is useful for the sake of explanation and discussion to give these various matters names; thus the vaccine lymph is called *vaccinine;* the granulations of Chaveau, *vaccinads;* variola lymph, *varioline*; and its corresponding elements, *variolads*. Instead of cells, globules, germs, granules, gemmules, protoplasm, germinal matter, or other descriptive names which have been given to the organic units, it will be convenient to adopt some such generic word as the "atom" of chemists. Monad has been appropriated in another sense, and "biad" from bios, (βίος life, evidently allied to *βία force*) the root of biology, may be conveniently employed. The ultimate organic atom of chemists, like the inorganic atom, is beyond the reach of the microscope; but these *biads* may be, or become visible. Physically they are like blood-corpuscles (*hæmads*).

The zymotic elements differ essentially in their powers, but it is not likely that they can all be distinguished by the microscope. They are known by their effects. By them and by other causes out of 1000 born in Liverpool, 518 children were destroyed in the first ten years of their life; some by small-pox, many by measles, scarlatina, whooping-cough, many by typhus and enteric fever; one disease prevailing in one year, another disease prevailing in another, but still yielding the like fatal results. This represents what Dr. Watt found at Glasgow long ago. Out of 1000 children born in London, 351 die under ten years of age by zymotic diseases and other causes; the deaths are less by 167 than the deaths in Liverpool. How much less is the loss of life by these diseases in the healthy districts of England! There, out of 1000, only 205 children die in the first ten years of life. The enormous difference cannot be ascribed to vaccination, as common in town as in country; the protection of life against small-pox alone leaves it still at the mercy of the other dangerous diseases of the insalubrious city. There the conditions are in favour of disease-life, and in the highest degree unfavourable to human life.

---

* Lavoisier called a well-known gas *oxygen*, on the ground that it forms in combination all the acids with which chemists were then acquainted. Ὄξος is "sour wine," "vinegar"; and "vinegarmaker" would be a tolerably literal translation of "oxygen," but by no means a good definition of that wonderful element. Some writers have foolishly objected to the name, since the discovery of hydrochloric, and other acids containing no oxygen. So when *zymosis* derived from the Greek root *ζύμη leaven* is employed to designate a series of disease processes in men and animals, it is not intended to confound these processes with fermentation. If fermentation expressed the idea, that word would be used. *ζύμη* is probably drawn by a similar process from ΖΕΩ to boil, seethe, bubble; the bubbling of boiling water, and fermentation presenting some points of resemblance; intestine motion and heat.

Protection against small-pox, and against all forms of imported disease, if that were practicable, should not be neglected; the isolation of the invaded individual; the destruction of the secretions by chemical agencies; chlorine, ozone (permanganate of potash), carbolic acid, sulphurous acid, vinegar, camphor, and other substances, found by experience to be destructive, or prejudicial to the zymotic elements, should all be brought into play. These elements are causes of death, but an order of causes lies still higher.

The primary object to aim at, is placing a healthy stock of men in conditions of air, water, warmth, food, dwelling, and work most favourable to their development. The vigor of their own life is the best security men have against the invasion of their organization by low corpuscular forms of life; for such the propagating matters of zymotic diseases may be held to be. Vaccinate by all means; but at the same time provide streets, spaces, dwellings, water, drainage. Do not leave the dirt in rookeries, in pits, in dunghills. What are municipal bodies, town councillors, aldermen, mayors, provosts good for, if they cannot by administrative measures displace rookeries by healthy habitations, supply the people with water, and with the means of "*cleanliness,*" which stands proverbially "*next to godliness*"?

If we ascend from zymotic disease to its generating element, and from this to bad dwellings, bad habits, and bad municipal organization, causes are often found lying beyond these in bad laws. A city becomes the seat of trade and manufactures, in which many workmen from the country are required: families are brought together, and are crowded in existing houses; and it is found impossible to extend the house accommodation by building new houses, on account of the existing land tenures. The owners, whether corporations or individuals, hold on limited tenures, and as they cannot sell the freehold, or grant leases for long terms of years, the land is unavailable for building purposes. Houses are not built to meet the demand, and the want of decent dwellings is inevitable. To abolish all the rookeries is possible now, with free and cheap locomotion, if the law give facilities to the acquisition of that necessity of healthy life—sites for dwelling-houses. A bad land tenure is a cause of death.

Again, as properties are often let on lease for terms of years at stipulated rents, under covenants by tenants to pay rates and taxes, the tenant cannot justly be called upon to pay within his term the cost of permanent improvements, which will pass into the landlord's hands when the lease expires; the landlord should by law pay the capital, the tenant the interest.

The study of the causes of death in the zymotic class enables us to lay down some rules for the limitation of their ravages.

1. This is a primary rule: place the population in the sanitary conditions found by experience to be most favourable to health. Without this preliminary, all the other measures are futile. The elements of the body fall into decay and degeneracy of themselves, under unfavourable conditions, without any external infection.

2. Fortify the body by a mild disease, if any such is known, against a severe disease. Vaccination, or even inoculation, if vaccination had not been discovered, is properly practised under this rule. But it should be universal to be really successful. The inoculation of a few spreads small-pox among the many. To operate on the mortality, protection against *every one of the fatal zymotic diseases is required;* otherwise the suppression of one disease-element opens the way to others.

3. The suppression of zymotic action by specific applications in the earliest stage of invasion is sometimes possible, as in the diarrhœal stage of cholera. Careful experiments on this matter are required; for the prodromal stage is not always detected, and treatment is either not tried, or, if successful, the existence of the disease itself is questioned.

4. The suppression of the generating beds of disease in unhealthy populations can scarcely fail to be efficacious. To suppress plague, suppress the wretched sanitary conditions of Egypt; to suppress yellow fever, go to St. Thomas, New Orleans, and its other breeding grounds; to put a stop to pandemic outbreaks of cholera, cleanse the waters of India, and improve the condition of the population; to extinguish enteric fever and typhus in our cities extinguish the rookeries.

5. Syphilis is dealt with on this principle under the Contagious Diseases Act. The forcible detention of infecting women in hospitals is humane and justifiable; but why is the principle not extended to both sexes? Here, to be successful, all the ascertainable sources must be stopped.

6. The destruction of the zymotic germs by chemical agents, by fire, and by disinfectants should in all cases be enforced.

7. Water in rivers charged with sewage, or shallow wells, conveys the germs unchanged (zymads) of some zymotic diseases, as it conveys animalcules and the ova of worms. The pure water of the hills is the safest.

8. The diffusion of several zymotic diseases, among them small-pox, measles, and scarlatina, is probably effected by detached flakes floating in the air. This danger is lessened by some such treatment as Dr. W. Budd has suggested.*

The chemical destruction of the dejections in these diseases, and especially in enteric fever and cholera, are measures of precaution which should never be neglected.

Earth is a great disinfectant, and the changes going on in the soil soon convert the excreta into harmless manures. There is no evidence to show that the disturbed cemeteries of the dead in past plagues have ever given rise to new outbreaks; and the dry earth applied on Mr. Moule's system is as safe a disinfectant as can be used, but in epidemic seasons the stuff should be buried and not be scattered on the ground. It would be well too, as in dangerous times such precautions cannot be adopted in dealing

---

* The following is a summary of the precautions recommended by Dr. W. Budd:

1. The room [in which the patient is detached] is dismantled of all needless woollen or other draperies which might possibly serve to harbour the poison.

1*. Thorough ventilation of the room to be maintained by an open fire and other means added.

2. A basin, charged with chloride or carbolate of lime or some other convenient disinfectant, is kept constantly on the bed for the patient to spit into.

3. A large vessel, containing water impregnated with chlorides or with Condy's fluid, always stands in the room for the reception of all bed and body linen immediately on its removal from the person of the patient.

4. Pocket-handkerchiefs are proscribed, and small pieces of rag are used instead for wiping the mouth and nose. Each piece, after being once used, is immediately burnt.

5. As the hands of nurses of necessity become frequently soiled by the specific excreta, a good supply of towels and two basins, one containing water with Condy's fluid or chlorides, and another plain soap and water, are always at hand for the immediate removal of the taint.

6. All glasses, cups, or other vessels used by or about the patient are scrupulously cleaned before being used by others.

7. The discharges from the bowel and kidney are received *on their very issue from the body* into vessels charged with disinfectants.

8. About the fourth day of the eruption the surface of the body, scalp included, to be anointed *twice a day* with olive oil slightly impregnated with camphor; the oiling to be continued until the patient is well enough to take a warm bath, in which the whole skin is well scrubbed, disinfecting soap being abundantly used. The baths to be repeated every other day until four have been taken.

9. Ten days after health is quite re-established the patient may, in new clothes, without risk, re-enter his family.

10. The children of the poor, who have no means of isolating their children, to be treated in small model hospitals or houses set apart by towns or parishes for the purpose.

11. The sewers to be kept in a state of permanent disinfection where the disease prevails. This is done in Bristol under the direction of the Health Officer.

with sewage, to disinfect it in the houses and in the sewers on its way to irrigation fields.

9. The assembly of large masses of men in pilgrimages, or in any way, produces often coalescences of zymotic elements, which thus acquire intense activity, and spread far and near: conditions for the regulation of such assemblages may be therefore fairly enforced.

10. The vessels which place distant shores in communication should be under strict sanitary regulation, to intercept the transit of epidemics.

11. The interception of the intercourse and commerce of nations by quarantine is injurious to their vital interests. It should be kept within the narrowest limits; and England should carefully abstain from treading in the steps of the fanatical populations of the Mediterranean. They should be invited to follow her example by its success.

12. As zymotic diseases of domestic animals are governed by the same general laws as the corresponding diseases of men, similar methods of prevention should be pursued in dealing with live stock.

By observing these simple rules we shall limit the ravages of common epidemics and perhaps avert those secular plagues which have several times depopulated Europe. New species of diseases,—of zymads may be generated, and these may under unfavourable conditions spread with destructive virulence among men, but never, we may hope, so as to recal the ravages of the Athens plague, of the Antonine plague in the second century, of the Gallus plague in the third century, of the dreadful Justinian plague of the sixth century, of the devastating black death of the fourteenth century, of the sweating sickness so fatal to Englishmen, and, still more recently, the great plagues of the seventeenth century. Cholera has been virtually subdued, and we have no reason to despair of success in the future encounters of science with these impalpable but fell destroyers.

II. Constitutional Diseases.

Constitutional diseases are of variable and uncertain seat. They are characterised by the production of matters, not its natural constituents, from the elements of the body, which they deteriorate or destroy. Cancer is a type; in its different forms it was fatal in the year to 2,650 males and to 5,895 females, chiefly after the age of growth—of reproduction—was over. Mortification occurs still later in life, and is more fatal to men than to women.

The Tubercular order occurs in some of its forms in early childhood. Then supervenes hydrocephalus, with tubercles on the brain and its membranes; or tabes mesenterica, with similar deposits in the mesenteric glands; or scrofula, with deposits in the bones and the integumentary system.

Phthisis is the most fatal not only of this order, but of all the forms of disease. It is especially the disease of youth and early manhood.

III. Local Diseases.

These include the inflammations of all parts of the body. By the production of pus they are associated with the second class of diseases. They include all the mechanical changes, such as hernia, as well as functional diseases, such as insanity. In England four tenths of the deaths fall under this great class.

The deaths ascribed to diabetes have increased of late years; the increase is very observable since 1858; and the mortality rose to its maximum in 1864, while since that year down to 1867 it has been stationary (see Table 12, p. 236). Diabetes is characterized by an

abundant flow of urine containing grape sugar, which has been traced to the blood, and by Bernard to a secretion in the liver of *glycogene* or *amyline*, transformed into sugar by the aid of a ferment.*

The Tables 26, 27, show the deaths in England from diabetes extending over a period of 20 years. In the first period (1848–54) the annual deaths were 405, in the second period 557: the mortality to a million living in the two periods was 23 and 28. The mortality of males in the second period was nearly the same as the mortality of females at all ages up to 15: then it became as 21 to 14 at the ages 15–25; in middle life and onwards (25–65) as 2 to 1; after 65 the disparity became as 4 males to one female. The deaths of children were few; the mortality doubled every 5 years up to 15; and then went on increasing up to the age of 75; when the fatal process gave way to others as life wore away.

IV. Developmental Diseases.

The child is prematurely born, is ill-formed, feeble; the mother perishes in giving birth to her children; or the body decays, and its elements fade away. The deaths under these heads are in the proportion of 17 in 100 deaths from all causes.

I have singled out one cause of death for investigation, on account of its special importance. It is childbirth.

The weddings of each year are followed, as the months roll on, by the births, and in some unhappy circumstances the births are darkened by the funeral pall of death. That does not often happen, but the cases are sufficiently numerous to attract attention on this ground alone. 3412 mothers died by childbirth in the year.

For 21 years on an average, 50 in 10,000 childbearing mothers died. It is 199 chances to 1 that the mother will survive; but at the bottom of the urn lies that one fatal black ball. Then risk is incurred five times by mothers on an average.

The chances of death vary from year to year: thus in 1848, out of 10,000, 61 mothers, while in 1857 42, died; in 1862–7 the proportion was 48 out of the same number bearing children. The mortality is greatest in first pregnancies.

Two grave defects in the registers of the United Kingdom deprive them of much of their utility as pedigrees, and as records of facts for the solution of the great problems of population. Neither the age of mothers at the births of each of their children, nor the order of birth, is recorded; so that the number of children borne by women at different ages, and in the course of their lives, cannot be ascertained. This defect was supplied in the first schedule of the Scotch Act, but the important parts of the schedule were unfortunately discontinued after 1855. Dr. Stark turned some of the precious results of that year's registration to account; and so has Dr. Duncan in his valuable work on Fecundity.† Dr. Duncan proves from various sources that the mortality in the first pregnancy is to that in subsequent pregnancies nearly as two to one; and from the data he has collected it may be assumed, until further observations are made, that about 1 wife in 8 or 10 is sterile.

How can we determine the number of firstborn children in England annually? It must evidently bear some relation to the marriages. Now the annual number of legitimate children in the six years 1862–67 was 695,597, and the annual marriages in the six years 1856–61, with which they may be fairly compared, were 162,681, of which 147,804 were mar-

* See a good account of the pathology of diabetes in Dr. J. H. Bennett's excellent lectures on clinical medicine, 4th ed., p. 909. See also Dr. Pavy's careful researches on the nature of diabetes, 2d ed., 1869. For a masterly exposition of the phenomena of the disease, see Sir Thomas Watson's lectures.

† See Dr. Stark's 1st Report to Registrar General of Scotland, p. xviii; also Dr. Duncan on Fecundity, Fertility, Sterility, &c. Black, Edinburgh, 1866, pp. 241–7.

riages of spinsters: so that the births to a marriage are 4·276; the births to each woman married are 4·706. The births to each procreant wife—if only 133,024, or *nine* in *ten* wives, have living children—must be 5·229. Consequently as families consist of one, two, three, four, up to ten or more children, and every family has one firstborn child, it is evident that the firstborn children in wedlock will be to the total children so born as 133,024 to 695,597; or as 1 to 5·229. We can from these proportions infer that about 19 per cent. of the children in wedlock are firstborn; but to get the number of women bearing first children, the mothers of the children born out of wedlock must be brought into account, and some corrections must be made. This being done, it will be found that the 3600 annual deaths in childbirth during the six years 1862–67 imply about 48 deaths to 10,000 delivered; and if, as is found by other observations, the mortality in first deliveries is proportionally to the mortality in subsequent deliveries as 2 to 1, the mortality among English mothers will be 80 in 10,000 for first children, and 40 for subsequent deliveries, taken in the aggregate.*

There were 1066 deaths in the year 1867 referred to metria (puerperal fever), and 2346 to the other dangers of childbearing, including, specifically, miscarriages 55, abortion 75, puerperal mania 85, puerperal convulsions 366, phlegmasia dolens 65, extra-uterine fœtation 11, retention of placenta 34, breast abscess 9, flooding 483, placenta prævia 149, rupture of uterus 41, deformed pelvis 10, operation for craniotomy 1, Cæsarian operation 4; the particular causes of 958 deaths being unassigned. In addition to these deaths by childbirth, the particulars of 521 deaths by other diseases after childbearing are given, as these other diseases were the main causes of death. Then 16 other deaths by diseases are specified as having occurred to pregnant women. There are about 576,262 women† with child, and the deaths among them would amount to 6339, at the rate common to their age. It is not likely that early pregnancy is mentioned in the certificates, unless it had a direct connexion with the death; so as 3949 of the deaths are here accounted for, the deaths from other diseases must have been less than the deaths among men from those other diseases at the corresponding ages. Small-pox, scarlet fever, enteric fever, typhus, cholera, are almost invariably fatal to the women with child attacked; but whether they enjoy a certain immunity from attacks of disease, well deserves inquiry.

I have endeavoured to show in the Tables 19–25 the mortality of childbearing women at different ages during the 7 years 1848–54, and 13 years 1855-67. In the former period 5·31, in the latter period 4·83 women in 1000 delivered died. The mortality was lowest in the middle of the childbearing age (25–35): then about 4 in 1000 died; at the earlier age (15–25) the mortality was 6 or 7 in 1000; so at the later age (35–45) it was 6; and at the extreme age of 45–55 it ranged up to 7 or 9.

The mortality is shown from *metria*, and from all other causes. It is twice as high from *metria* at the earlier age 15–25 as it is at the subsequent ages: thus the rate is then 2·66, and afterwards 1·38 in the 13 years 1855–67. The mortality from all other causes is higher in the early than in the middle period; but it increases rapidly as age advances. The higher mortality from metria in early life can scarcely be explained, without taking into account the element of non-recurrence in zymotic diseases. Few recover from severe attacks of metria, but may not those who have had slight attacks be to some extent exempt for the future? The first deliveries test the mother's physical capacity as a child-bearer. And for obvious reasons, as where the pelvis is narrow, some succumb in the hour of trial.

---

* See Note on Firstborn, page 226.

† Equal to three-fourths of the annual births, pregnancy running about nine months.

In England the mortality by childbirth to every 10,000 *women living*, in the four decenniads of age from 15 to 55, was 3·96, 8·96, 8·66, and 0·65 in the period from 1855–67; in the preceding period it was higher at all ages. The excess in the middle age 25–35 is due to the great proportion of married childbearing women at that age, and to the number of pregnancies then occurring. The excess of violent deaths among males of 15 and under 35 does not raise the mortality from all causes to the same pitch as the mortality of females. At the age 25–35 the deaths to 10,000 living men are 95·5, while the mortality of women at the corresponding age is 98·7; the excess is 3·2, with which the mortality by childbearing, 8·96, may be compared.

The mortality by childbirth is much less under the age of 35 in the healthy districts than it is in London and the large towns; but after 35 the women in the country die by childbearing in larger numbers than the women in the towns. In towns they are more exposed to puerperal fever; in the country many, probably, perish for want of skilful help. During the ten years 1851–60, to 10,000 births in the Eastern Division (Essex, Suffolk, Norfolk), 41 mothers died in childbirth, in London 49, in Lancashire and Cheshire 54, in Wales and Monmouthshire 61: in the healthy districts the mortality in childbearing was 43, in the large towns 49. Nothing in England approaches the fatality to mothers in Wales, where they must be greatly mismanaged.*

In the English and Welsh healthy districts the mortality at the ages 15–45 of women is higher than the mortality of men from all causes: thus, of 1000 living at the age 25–35, the men die at the rate of 8·18, the women at the rate of 8·94; the excess on women is 0·76; and the excess is nearly the same through the whole of the procreant part of life.†

How can the dangers of childbearing, which have been traced to various causes, be alleviated? This question was asked many years ago, and was answered by the establishment of lying-in hospitals. Many of the mothers are poor married women; and some of them, unmarried, abandoned, inexperienced, repudiated by society, incur double dangers. What seemed more likely to save these women in travail from peril than the Maternity? Unfortunately, experience has proved that the assemblage of childbearing women under one roof gives rise to fatal epidemics of childbirth fever; and the mortality is almost invariably in excess of the mortality in detached dwellings. No help is to be expected from Maternities.

There is hope, however, to see the mortality sensibly reduced by the progress of midwifery. The mechanism is better understood. And various difficult problems will no doubt be solved, as has been the case in *placenta prævia*.

Cases in country places are in the hands of midwives and men, who are sometimes skilful by instinct, but are often not well versed in the art as it is now practised by the skilful. Educated nurses as well as physicians are required to secure the best chance of life to mother and child. And it is satisfactory to know that this want is now attracting attention. The Lady who has done so much good in other directions is, I believe, directing her attention to this question.

Young mothers themselves require instruction and special care. By living naturally and in conformity with the laws of life, they save at the same time themselves and their offspring. Few women in advanced pregnancy can stand hard work, to which they are sometimes exposed.

The utmost care on the part of medical men who practise as accoucheurs is indispensable. That puerperal fever has been transmitted from patient to patient is deplorably true. No precautions can be too great.

---

* See Tables 23, 24, p. 244.
† See Table 22, p. 243.

Then the contagion of scarlatina evidently in some cases lights up a puerperal disease, which has not yet been distinguished from puerperal fever. So does erysipelas, and so do perhaps other diseases. The dangers of a general hospital to puerperal women have been revealed by recent experience. Students cannot study in the dissecting room and at the same time practise midwifery without risk.

Nurses are often mediums of disease. Nothing is more fatal than any of the forms of dirt and uncleanliness in the lying-in chamber. Where fever comes on, disinfectants should be strenuously used.

By the greater attention this subject will attract, now its full importance is precisely known, we may hope to see a great diminution in the risks of childbirth.

At present the mortality is greater among women whose lives are insured at the childbearing age than it is among men. And the premium for the insurance of a pregnant woman is generally higher than the common tabular rates. The previous data show that the general risk of a first delivery in England is covered by a premium of 16*s.* on 100*l.*, and of subsequent deliveries by a premium of 8*s.*; the premium of 10*s.* for each of 200 deliveries taken indiscriminately covers the common risks. It has been noticed that after a woman has borne nine children*, the pregnancies often follow each other in rapid succession, probably from an obvious physical cause, and that the danger increases; age advancing is itself a danger.

V. Violent Deaths.

This class of deaths by electrical, chemical, and mechanical agencies presents in the first instance distinct changes in the body. A living man thrown into the flames of a fiery furnace is consumed as instantly as so much coal, and is converted into nearly the same chemical products. An actress is scorched by her clothes taking fire, and dies in a few hours; or a burnt child lives for some days, and then dies of ulcer of the duodenum. The ulcer of the duodenum is the immediate cause of death; but we ascend from the ulcer to the burn; from the burn to the combustible dress; and from that, perhaps, to the negligence of the mother. Poisons give rise to trains of morbid processes, which are easily confounded with zymotic and with local diseases. Mechanical injuries produce physical, chemical, and vital changes; if not immediately fatal, they are generally followed by inflammation and its consequences. Thus the deaths of this class are allied on the one hand to local diseases by their pathology, and to zymotic diseases by their external causation; but this is their distinctive character: they can always be referred to some external cause, and that external cause is generally controllable by human agency.

It is only correct to say, that deaths by violence are more frequent in civilized than in barbarous communities, when we leave out of sight the slaughters of war and the perils of starvation. But as the progress of civilization depends very much upon the free application and employment of the vast forces of nature in the intercourse and arts of life, it is found practically in this country that deaths by violence are rapidly increasing in England. Special precautions are demanded.

There is no increase of death from murder and manslaughter in the 10 years 1858-67, nor is there any increase in the deaths ascribed to suicide; but in the deaths said to be by accident or negligence the increase is too manifest. Thus 7 in 10,000 died by violence in the year 1857; and 8 in 10,000 in the year 1867. The deaths by violence to the same population ranged from 7·16 to 7·60 in the four years 1851-54; from 7·95 to 8·35 in the four years 1864-67.

* See Duncan on Fecundity, Fertility, Sterility, &c., pages 131 and 247.

To get at the primary causes, the violent deaths for each of the five years 1863–67 are given in a series of tables (pp. 174–204), under various heads. The deaths of males and females are classed under the heads of (1) railways, (2) mines, (3) mechanical injuries elsewhere, (4) chemical injuries elsewhere, and (5) asphyxia, with a great variety of sub-divisions. A great increase in the deaths on railways and in coal mines is noticeable.

I have the honour to be,
Sir,
Your obedient servant,
WILLIAM FARR.

To
The Registrar General.

NOTE on FIRSTBORN (*referred to on page* 223).

To get the number of *firstborn* children by *mother* from the total number of children c born in wedlock to w wives: let 0·9 or any fraction s be the co-efficient of *fertility*, then it is evident that $sw = w'$ = number of procreant wives out of w wives. $\frac{c}{w'} = \frac{c}{sw} = f = \frac{695,597}{133,024}$ = average number of children in the family of a fertile mother, made up of families compounded variously of one, two, three . . . n children; unless the wife has before marriage borne children every family thus constituted has necessarily one *firstborn* child to mother: and the number of *firstborns* in the legitimate births of a year are thus determinable, as they $= w' = \frac{c}{f}$

To determine from the English returns the mortality from childbirth, on the assumption that the first child-bearing is twice as fatal as those following, we have this equation:

$$2xa + xb = d = \text{deaths by childbirth} \quad \therefore x = \frac{d}{2a + b} = \cdot 003975 = \frac{3,600}{905,590}$$

where $2x$ represents the rate of mortality in the first pregnancy, a represents the number of such childbirths in the given year, and b=the childbirths of all other orders from second to last inclusive.

Let d include the mothers either married or single dying in childbirth. Then to complete the estimate of the firstborn the children born out of wedlock must be brought into account; their average numbers in the six years were 46,181. What numbers of children in the aggregate do these mothers bear out of wedlock? not *two* probably on an average: and if the proportion of the first-born among the children is taken at *two* in *three* it will imply that two such women bear on an average three illegitimate children; that two-thirds of the illegitimate are firstborn.

ANNUAL BIRTHS IN ENGLAND IN THE SIX YEARS 1862–67.

	Total Children Born.	Firstborn.	Second-born and others.
	$(a + b)$	(a)	(b)
Children born -	741,778	163,812	577,966
Legitimate -	695,597	133,024	562,573
Illegitimate -	46,181	30,788?	15,393?

ENGLAND.

ANNUAL MARRIAGES in the 6 years 1856–61 -	162,682
HUSBANDS marrying for FIRST TIME -	139,930
WIDOWERS - - - - - - - -	22,752
WIVES marrying for FIRST TIME -	147,805
WIDOWS - - - - - - - -	14,877
CHILDREN BORN ANNUALLY, 1862–67 - -	741,778
IN WEDLOCK - - - - - -	695,597
OUT OF WEDLOCK - - - - -	46,181
(d) ANNUAL DEATHS of MOTHERS by CHILDBEARING in the 6 years 1862–67	3,600

The above reasoning supplies us with the means of answering this question approximatively: What is the proportion of firstborn to mothers in the population? Among the portion of the population born in wedlock nearly 1 in 5, or 19 in 100, are firstborn. This proportion could only be disturbed to any extent by emigration or by a difference between the rate of mortality among the firstborn and the subsequent born children of families. The proportions among the children not born in wedlock would be very different; and there is reason to believe that the casualties of infancy cut down their numbers.

The number of men exceeds the number of women who marry more than once; hence the proportion of firstborn children to total children of fathers is less than the proportion of firstborn children to mothers. Thus the mean annual number of children born in wedlock in England (1862–67) was 695,597; the mean annual number of marriages (1856–61) was 162,682; that is 162,682 men married 162,682 women in those years; now if we divide 695,597 by the annual number of husbands marrying one or more times in their lives, namely, about 139,930, the mean number of legitimate children by one wife or more to each husband is 4·971.

Thus if the fathers marrying at 28, aged 34 when their children are born, divide their property equally among their legitimate children, and nine in ten fathers have children, the nine fathers will have on an average 5·52 children, and will leave at death, taken at the age of 64, about 3 children, so the property will be divided into 3 parcels on an average. This is exclusive of the sub-divisions of the property of childless fathers.

In France the proportions of children are much lower: to each husband only 3·637 children are born to his one or more marriages: and, taking nine in ten as fertile, the average family will consist of 4·041 children; so, taking the proportions to survive as the same, the property will only be divided into *two* parcels.

The firstborn to fathers in 100 of the population will be 18 in England, 25 in France; *one* in *five* or *six* in England, *one* in *four* in France, is a firstborn child.

Second-born children are fewer in number than firstborn: and firstborn = last-born children.

TABLE 1.—**Excess** or **Defect** of **Annual Rate** of **Mortality per 1000** of **Males** and **Females** in **England** in the **Year 1867** over or under the **Mean Annual Mortality** of the **30 Years 1838–67.**

	AGES.—MALES.												
	ALL AGES.	0–	5–	10–	15–	25–	35–	45–	55–	65–	75–	85–	95 &upwds

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

‡ The number of persons executed in the several years will not necessarily correspond with that in the same years of the "Criminal Returns," inasmuch as the executions recorded in each year in the latter are derived from the dates of conviction, while the numbers in this Table are classed under the years in which the deaths are registered.

§ The cases of angina membranacea which would now be put to diphtheria were formerly classed under the same head as scarlatina, but were distinguished in the notes.

TABLE 11.—**Causes** of **Death** registered in **England** in each of the **Ten Years 1858-1867**—*continued.*

Class.	CAUSES OF DEATH.	1858	1859	1860	1861	1862	1863	1864	1865	1866	1867

† In the years 1851–57 cases of so-called "debility" and "premature birth" were classed together; when the new classification was introduced "premature birth" was kept apart, and "debility" and "atrophy" were thrown into one line.

‡ For the years 1858–67 the number of deaths in which the cause was not specified was distributed pro rata over all the causes in the Table.

	4 Hydrocephalus	396·1	434·2	385·6	368·6	332

* The Mean Annual Mortality in the 15 years from All Causes and from Specified Causes is the mean of the three quinquennial periods, and does not correspond exactly with the totals of the Orders and Classes; because under certain heads, for example, *Homicide*, *Suicide*, and *Causes not specified*, &c., the complete details cannot be given for the entire period.

† Mean of 3 years. ‡ Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

§ Mean of 2 years.

NOTE.—In a certain number of cases in each year the cause of death was not stated. In calculating the proportional numbers, since 1855, they have been distributed pro ratâ over all the causes in the Table.

TABLE **14.**—**Mean Annual Rate** of **Mortality** in **England** from each CLASS of CAUSES and from each CAUSE during **Three Periods** of **Five Years**; and **Rate** of **Mortality** in the Year **1867**—*continued.*

TABLE **21.—Mortality** of **Mothers** by **Childbearing** at **different Ages** in **England,** in the **7 Years 1848–54,** and in the **13 Years 1855–67.**

AGE of MOTHER.	ANNUAL RATE of MORTALITY. To every 1000 MOTHERS bearing CHILDREN, the NUMBER of DEATHS by						AGE of MOTHER.
	Childbirth.	Metria.	Childbirth and Metria.	Childbirth and Metria.	Childbirth.	Metria.	
	7 Years 1848–54.			13 Years 1855–67.			
15–25	3·91	2·77	6·68	6·44	3·78	2·66	15–25
25–35	2·77	1·48	4·25	3·86	2·48	1·38	25–35
35–45	4·79	1·54	6·33	5·59	4·18	1·41	35–45
45–55	7·20	1·63	8·83	6·78	5·39	1·39	45–55
15–55	3·58	1·73	5·31	4·83	3·22	1·61	15–55

From the Swedish returns (1776–1855) it appears that 100 childbearings produced 101·62 children, viz., 2·82 stillborn, 98·80 quickborn; consequently 100 quickborn children imply 101·21 childbearings. In the year 1852 in England 624,012 children were born alive by 617,902 mothers; of whom 6,036 bore twins, 87 bore triplets. So 99 mothers bore 100 live children; or 100 live children implied 99 childbearings. To these should be added the childbearings yielding still-births unregistered.

TABLE **22.—Relative Mortality** of **Men** and **Women** at different Ages in **England** in the **Years 1851–60;** in the **64 Healthy Districts** of **England** in the **Years 1849–53;** and in **Sweden** in the **Years 1830–35.**

ANNUAL MORTALITY FROM ALL CAUSES TO 1,000 LIVING.

* This death was registered on 19th January 1866.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A, as Ashford, East.]

For names of Towns, such as Chester, Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 253) *and "Index of certain Towns"* (page 263).

A

Aberayron, 596.
Abergavenny, 578 *a*.
Aberystwith, 597.
Abingdon, 123.
Alcester, 405.
Alderbury, 263.
Alnwick, 559.
Alresford, 113.
Alston, 564.
Alton, 114.
Altrincham, 454.
Alverstoke, 97.
Amersham, 148.
Amesbury, 262.
Ampthill, 181.
Andover, 118.
Anglesey, 623.
Ashborne, 447.
Ashby-de-la-Zouch, 414.
Ashton-under-Lyne, 474.
Askrigg, 537.
Aston, 395.
Atcham, 359.
Atherstone, 397.
Auckland, 542.
Axbridge, 324.
Axminster, 279.
Aylesbury, 151.
Aylsham, 232.

INDEX OF SUB-DISTRICTS.

[In this alphabetical arrangement the principle is adopted of placing the Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G as "Grinstead, East;" St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to the order in which it appears in the arrangement of the Districts in the Tables of Abstracts; thus, Abbey Holme (569; 2) is the 2d Sub-District of the Wigton District, No. 569.]

Sub-District.	District.	No.
A		
Abbey	Bath	326; 3
Abbey Holme	Wigton	569; 2
Abbots Bromley	Uttoxeter	374; 2
Abbotsbury	Weymouth	274; 4

ALPHABETICAL INDEX

TO

REGISTRAR-GENERAL'S THIRTIETH ANNUAL REPORT AND APPENDIX.

PAGE

AGES of Persons married in 1867, distinguishing Bachelors, Spinsters, Widowers, Widows 26–27

at Death of Males and Females registered in 1867 in Divisions, Counties, and Districts 98–119

at Death of Males and Females in England registered from different Causes, in 1867 120–125

at Death of Males and Females in England registered from different Supplemental Causes, in 1867 126–129

at Death of Males and Females in London registered from different Causes, in 1867 130–135

AREA in Statute Acres of each Division, County, District, and Sub-district . 28–82

ARMY; Strength and Mortality in the Army at home and abroad . . xxvi

Annual Rate of Mortality per 1000 in Great Britain, England, France, Austria, and Italy, including the Deaths of Soldiers *at Home and Abroad*, 1857–67. (Table 30.) . . . xxvii

Average Strength of the British Army at Home in 1867. (Table 31.) xxvii

Mortality of the Army at Home in 1867. (Table 32.) . . xxvii

Average Strength of the British Army Abroad in each of the Years 1864–67. (Table 33.) xxviii

Number of Deaths in the British Army at Home and Abroad, 1864–67. (Table 34.) xxviii

Annual Rate of Mortality per 1000 amongst Officers and Men in the Army Abroad, 1858–67. (Table 35.) xxviii

Strength at Home and Abroad in 1861, showing the Numbers born in the different parts of the United Kingdom and elsewhere. (Table 36.) xxix

Deaths in Army Abroad of Officers and Men belonging to England and Wales and to Great Britain, 1858–67. (Table 37.) . xxix

AUSTRIA; Estimated Population in middle of the Years 1853–67. (Table 26.) xxiv

Number, and Proportion per 1000 to Population, of Marriages, Births, and Deaths, in each of the Years 1853–67. (Table 27.) . xxv

Annual Rate of Mortality per 1000 in the Austrian Army, 1857–67. (Table 38.) xxix

BIRTHS registered in England, in each Year, 1838–1867. (Table 1.) . i

proportion to Population in each Year, 1838–67. (Table 2.) . ii

Legitimate and Illegitimate in England in the Years 1845–67, and Proportion of Males to Females. (Table 9.) . . . ix

in Counties, in 1867. Numbers, Legitimate and Illegitimate, of the two Sexes; Proportions of Male to Female Births, Legitimate and Illegitimate; Proportion of Illegitimate Births to Total Births. (Table 10.) x

in 1867 x

proportion to Population in different parts of the Country . . xi

BIRTHS—*continued.* PAGE

proportion of Male and Female Children born in the several Counties of England during each of the Years 1858–67. (Table 11.) xi

proportion to Population in Counties for each of the Years 1857–67. (Table 12.) xii

of the two Sexes xii

proportional Number of Births in each Quarter to 1,000 Births in the average Quarter, 1838–67. (Table 13.) xiii

registered in England, and proportion to Population, in each Quarter of the Years 1838–67. (Table 14.) xiii

in the four Seasons xiv

out of wedlock xiv

in quarter ending March 1867 xxxiv

in quarter ending June „ xxxviii

in quarter ending September „ xli

in quarter ending December „ xlviii

registered in each of the Divisions, Counties, Districts, and Sub-districts in 1867 28–82

excess over Deaths in each of the Divisions, Counties, Districts, and Sub-districts in 1867 28–82

registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1867 . . . 86–89

of Children born out of Wedlock registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1867 90–93

Firstborn children 222, 226

BIRTH-RATE in Counties in each of the Years 1857–67. (Table 12.) . xii

in England in each Quarter of the Years 1838–67. (Table 14.) . xiii

BUDD, DR. W.; precautions for preventing spread of Scarlet Fever . . 220

BURNS AND SCALDS; Deaths and Mortality at different Ages, in the Years 1848–67. (Table 31.—App.) 247

CAMBRIDGE; increased Mortality xxxvi

CAUSES of DEATH of Males and Females in England, at different Periods of Life, in 1867 120–125

(Supplementary Table) of Males and Females in England at different Periods of Life, in 1867 126–129

of Males and Females in London at different Periods of Life, in 1867 130–135

of Males and Females in England, and in each of the Divisions and Counties, in 1867 136–159

(from certain zymotic and other Causes) in 1867, in the Divisions, Counties, and Districts of England 160–171

Dr. Farr's Letter to the Registrar General thereon . . . 207

their nature and variety 207–209

certified and uncertified 208

primary and secondary 208

Injuries, Violence, and Accident 209

shortening of the Mean Lifetime 209

a Registration Medical Officer necessary 210

the New Nomenclature 210

registered in England in each of the Ten Years 1858–67. (Table 11.—App.) 231–233

Mortality from the several Causes in each of the Years 1851–67. (Table 12.) 234–236

CAUSES of DEATH—*continued.* PAGE

proportional Numbers dying from each Cause in 1867. (Table 13.—App.) 237

Mean Annual Rate of Mortality from different Causes during three periods of Five Years, and in 1867. (Table 14.—App.) . 238–239

in England, in 1867, arranged in the order of Mortality. (Table 15.—App.) 240

CHILDBIRTH; Mortality in first and subsequent deliveries 222

Firstborn Children 222, 226

Causes of Mortality of Women from Childbearing . . . 223

Mortality of Childbearing Women at different Ages . . . 223

Fatality of Metria at early Childbearing Ages 223

Mortality from Childbirth in different localities 224

Lying-in Hospitals 224

Maternities 224

Progress of Midwifery 224

Transmission of Puerperal Fever 224

Nurses often mediums of Disease 225

Insurance Premiums on the Lives of Pregnant Women. . . . 225

Deaths in 1867, at different Ages, of Women after Childbearing, classed under different Diseases, and neither referred to Childbirth nor to Metria in the Abstracts. (Table 16.—App.) . 241

Deaths of Women in 1867 who were returned as pregnant, classed under certain Diseases. (Table 17.—App.) . . . 241

Deaths of Women from Metria and Childbirth in the 21 Years, 1847–67, and proportional Deaths of Mothers to Children born alive. (Table 18.—App.) 242

Mortality of Women by Childbearing, at different Ages, in 1848–54, and in 1855–67. (Table 19.—App.) 242

Deaths of Mothers bearing Children, at different Ages, in 1848–54, and in 1855–67. (Table 20.—App.) 243

Mortality of Mothers by Childbearing, at different Ages, in 1848–54, and in 1855–67. (Table 21.—App.) 243

Excess of Mortality of Women over Mortality of Men, at different Ages, in England, 1851–60; in Healthy Districts, 1849–53; and in Sweden, 1830–35. (Table 22.—App.) . . . 243

Annual Mortality from, in 1851–60, in England, in Healthy Districts, and in Large Towns. (Table 23.—App.) . . 244

Deaths of Women in 1851–60, in Registration Divisions of England, in Healthy Districts, and in Large Towns. (Table 24.—App.) 244

in Sweden, 1830–35. (Table 25.—App.) 244

COLONIAL REGISTRATION; Letter from Registrar General to Colonial Office thereon lxvi

Registration Arrangements in Australian Colonies . . . lxvii–lxxiii

" " North American Colonies . . lxxiii–lxxv

" " West Indian Colonies . . . lxxv–lxxvi

" " Mediterranean and African Colonies . lxxvi

" " Heligoland lxxvi

" " Eastern Colonies lxxvii

" " India . . . . . lxxvii–lxxix

" " Islands in British Seas . . . lxxx

CONSTITUTIONAL DISEASES 221

CROYDON; its drainage and mortality xxxix

CYNANCHE MALIGNA and DIPHTHERIA; Deaths in England at different Ages in each of the 12 Years, 1855–67. (Tables 2. and 3.—App.) . 227
